

ICF-SW7600

SERVICE MANUAL

*US Model
Canadian Model
AEP Model
UK Model
E Model
Australian Model*

SPECIFICATIONS

Circuit system FM: Superheterodyne
AM: Dual conversion superheterodyne

Frequency range FM: 76–108 MHz
87.5–108 MHz
LW: 150–528 kHz
150–285 kHz
MW: 530–1,610 K
(With the MW CH STEP selector at 10 kHz)
531–1,611 kHz
(With the MW CH STEP selector at 9 kHz)
SW: 1,615–26,100 kHz
1,615–29,995 kHz

Dimensions

Approx. 191.2 × 118 × 32.3 mm (w/h/d)
(7⁵/₈ × 4³/₄ × 1⁵/₁₆ inches)

Weight

including projecting parts and controls

Accessories supplied

Approx. 615 g (1 lb. 5.7 oz.) including batteries
Stereo earphones (1), Ear pad (2), AC power adaptor (1, except the model for Oceanian countries), AC plug adaptor (1, except the model for Europe, North America and Oceanian countries), Wave handbook (1), Antenna connector (1), Carrying case (1), Compact antenna (1)

Design and specifications subject to change without notice.

Antennas Telescopic antenna (FM/SW)
Built-in ferrite bar antenna (MW/LW)

Speaker Approx. 77 mm (3¹/₈ inches) dia. 8 ohms

Power output 400 mW (at 10% harmonic distortion)
Recording output jack (minijack)
output level 0.775 mV (–60 dB)
output impedance 1 kilohm
Headphone jack (stereo minijack) for
16 ohm stereo earphones

Power requirements 6 V DC
Four R6 (size AA) batteries
Supplied AC power adaptor (110, 120, 220 or
240 V AC adjustable, 50/60 Hz)
Optional DCC-127A car battery cord for use
with 12 V car battery
Optional DCC-240 car battery cord for use
with 24 V car battery

Battery life Approx. 10 hours of listening for four hours
a day at a normal volume, using Sony SUM-3 (NS)
batteries

SAFETY-RELATED COMPONENT WARNING!!

COMPONENTS IDENTIFIED BY MARK Δ OR DOTTED LINE WITH MARK Δ ON THE SCHEMATIC DIAGRAMS AND IN THE PARTS LIST ARE CRITICAL TO SAFE OPERATION. REPLACE THESE COMPONENTS WITH SONY PARTS WHOSE PART NUMBERS APPEAR AS SHOWN IN THIS MANUAL OR IN SUPPLEMENTS PUBLISHED BY SONY.

ATTENTION AU COMPOSANT AYANT RAPPORT À LA SÉCURITÉ!

LES COMPOSANTS IDENTIFIÉS PAR UNE MARQUE Δ SUR LES DIAGRAMMES SCHÉMATIQUES ET LA LISTE DES PIÈCES SONT CRITIQUES POUR LA SÉCURITÉ DE FONCTIONNEMENT. NE REMPLACER CES COMPOSANTS QUE PAR DES PIÈCES SONY DONT LES NUMÉROS SONT DONNÉS DANS CE MANUEL OU DANS LES SUPPLÉMENTS PUBLIÉS PAR SONY.

FEATURES

- An LW/MW/SW/FM stereo receiver with world-wide band coverage.
- Quartz controlled PLL (Phase Locked Loop) synthesizer system using a microcomputer for easy pinpoint tuning. The tuned frequency is digitally displayed.
- Fine tuning control for precise tuning.
- SSB (Single side band) can be received.
- Provided with a recording output and a remote control jack. Connecting the unit to the optional Sony TCM-27 cassette-corder using these jacks, you can start recording programs at a desired time.
- Various ways of tuning
 - Direct tuning** ... Tuning in the station by inputting the frequency of the station directly.
 - Manual tuning** ... Even if you don't know the frequency of the station, you can tune in the station precisely.
 - Scan tuning** ... An automatic searching of a station.
 - Preset tuning** ... Up to 10 stations can be preset for button-touch tuning.
- Other features
 - Timer standby** ... The function to receive a desired station at a desired time.
 - Sleep timer** ... Turning the radio off automatically in 65 minutes
 - Power sources** ... Three different power sources: internal batteries, house current, car battery. With the supplied AC power adaptor, any AC power source is available.

• Classification by frequency coverage

Type \ freq.	FM	AM
TYPE 1	76 — 108MHz	150 — 29995KHz
TYPE 2	87.5 — 108MHz	150 — 29995KHz
TYPE 3 (Saudi Arabia)	87.5 — 108MHz	150 — 285KHz 531 — 26100KHz
TYPE 4 (Italian)	87.5 — 108MHz	150 — 285kHz 531 — 1602kHz 3850 — 26100KHz

SECTION 1

GENERAL

1-1. LOCATION AND FUNCTION OF CONTROLS

Front Panel

- 1 Display window
- 2 TUNE (tuning) indicator
Lights up when a station is tuned in.
- 3 SLEEP (sleep timer) button
- 4 ON/OFF (power) button
- 5 POWER/LOCK switch
Set this switch to POWER, then press the ON/OFF button to turn on the radio. Set the switch to LOCK when carrying the radio. When this switch is set to LOCK, the power will not be turned on even if you press the ON/OFF button.
- 6 KEY PROTECT button
- 7 SCAN TUNING START STOP/STANDBY button
- 8 MANUAL TUNING/SET button
- 9 BAND/ALARM (alarm set) button
- 10 ENTER/TIME (time set) button

- 11 Telescopic antenna
- 12 SENS DX • • LOCAL (FM/AM sensitivity) selector
- 13 EXT ANT (external antenna) jack
- 14 TAPE REMOTE jack
- 15 TAPE REC OUT jack
- 16 (headphones) jack
- 17 DC IN 6 V (external power input) jack
- 18 LIGHT button
Press to illuminate the display window for about 15 seconds.
- 19 PRESET/DIRECT TUNING buttons
- 20 FM/EXECUTE button
- 21 AM/EXECUTE button
- 22 Speaker

Rear Panel

- 23 FINE TUNING control
- 24 AM MODE selector
- 25 TONE selector
Music: for listening to music
News: for listening to news
- 26 VOLUME control
- 27 Stand
- 28 MW CH STEP (MW channel step) selector
- 29 Battery compartment

1-2. HOW TO SET THE CLOCK

- 1 Set POWER/LOCK to POWER.
- 2 Press SET while keeping TIME pressed to adjust the clock to the current time.
Each press on SET advances the time digit by one.
To advance the time digits rapidly, keep SET pressed.

- 3 Release TIME.
The clock will begin to operate.

1-3. DIRECT TUNING

- 1 Set POWER/LOCK to POWER.
- 2 Press ON/OFF.
The radio is turned on.
- 3 Press the desired band (FM/EXECUTE or AM/EXECUTE) button.
To receive SW, MW, LW, press AM.
- 4 Input the frequency of a desired station by pressing PRESET/DIRECT TUNING.
- 5 Press the same band button again within 5 seconds.
The station will be tuned in.
- 6 Adjust the volume.

e.g. AM 810 kHz

To turn off the radio, press ON/OFF.

Setting the clock while listening to the radio

You cannot set the clock while you are listening to the radio. Be sure to press ON/OFF to turn the radio off and set the clock.

The display when the radio is turned off

The current time is displayed.

Zero second adjustment

If you want to adjust the time exactly to the second with a telephone time signal, proceed as in the following example.

Example: To set to 15:15

- 1 Adjust the time indication to 15:15 and keep TIME pressed.
- 2 Release TIME simultaneously with the telephone time signal.
The clock will then begin to show the precise time.

To improve receiving condition

If you input a wrong frequency

Press FM/EXECUTE or AM/EXECUTE again and input the correct frequency.

If you do not press FM or AM EXECUTE within 5 seconds after you input a frequency

The frequency indication turns to the previous one and you will hear the station of its frequency.

When the frequency near the input frequency is displayed

The frequencies which this radio receives are allocated in the following intervals depending on the broadcast band.

If you input a frequency that does not match these intervals, the frequency just below the one that you input will be tuned in and will be displayed.

FM	0.05 or 0.1 MHz	SW	5 kHz
MW	9 kHz*	LW	3 kHz

* Possible to change to 10 kHz depending on the country where used.

If TRY AGAIN! indication appears

If you input the frequency outside the frequency range, TRY AGAIN! blinks. When you press FM/EXECUTE or AM/EXECUTE again, this indication will disappear. If you do not press the button, it will disappear after 5 seconds and the frequency of the previously tuned station will appear.

When the sound is distorted

Normally set SENS to DX, however, when the sound is distorted set it to LOCAL.

When you are listening to the news

Set TONE to NEWS. Human voice will be heard more clearly. When you are listening to music, set it to MUSIC.

1-4. MANUAL TUNING

- 1 Set POWER/LOCK to POWER.
- 2 Press ON/OFF.
The radio is turned on.
- 3 Press MANUAL TUNING (+ or -) repeatedly while keeping BAND pressed to search for the approximate frequency of a desired station.
The lowest frequency of each band or the meter band of SW appears in the display.
If you keep MANUAL TUNING pressed, the band changes continuously.
- 4 Press MANUAL TUNING (+ or -) repeatedly to search for a desired station.

To prevent accidental change of the receiving station

Press KEY PROTECT. The mark appears in the display window and all the buttons on the front panel will not work.
To release the KEY PROTECT function, press KEY PROTECT again.

When the station is tuned in

The TUNE indicator lights up.

Frequency band changes continuously

If you keep MANUAL TUNING (+) pressed, the frequency band being tuned in will change from LW to MW, SW, FM and then back to LW.

What is meter band?

SW is divided into 13 bands by the wave length (meter).
Each band is called meter band.

1-5. SCAN TUNING

- 1 Set POWER/LOCK to POWER.
- 2 Press ON/OFF.
- 3 Receive a broadcast band by pressing MANUAL TUNING while keeping BAND pressed, or by pressing PRESET/DIRECT TUNING.
- 4 Press SCAN TUNING START/STOP.
Within the frequency range of the table on the right page, scan tuning will begin and stop automatically for 1.5 seconds when a station is received and then the tuning indicator lights up.
- 5 Press SCAN TUNING START/STOP again to listen to the station being received.
- 6 Tune in the station more precisely by MANUAL TUNING (+ or -), if necessary.

The frequency range and the tuning interval of each broadcast band

Broadcast band	Frequency range	Frequency allocation	
LW	150—285 kHz	3 kHz step*1	Saudi Arabia
	150—528 kHz		Other countries
MW	531—1611 kHz	9 kHz step	
	530—1610 kHz	10 kHz step	
A M	1615—2245 kHz		*2
	2250—2550 kHz		120 meter band
	3150—3450 kHz		90 meter band
	3850—4050 kHz		75 meter band
	4700—5100 kHz		60 meter band
	5900—6250 kHz		49 meter band
	7000—7400 kHz		41 meter band
	9400—10000 kHz		31 meter band
	11500—12150 kHz		25 meter band
	13500—13900 kHz		21 meter band
	15000—15700 kHz		19 meter band
	17450—18000 kHz		16 meter band
	21400—21950 kHz		13 meter band
	25600—26100 kHz		11 meter band
FM	26105—29995 kHz		*3
	87.50—108.00 MHz	0.05 MHz step	*4
	76.00—108.00 MHz	0.1 MHz step	*5

*1 Some of the LW stations are not tuned in with the 3 kHz interval. When you try to tune in them, first tune in the frequency near them and then tune in precisely with FINE TUNING.

*2 These frequencies can be tuned in either by direct tuning or manual tuning but cannot be selected by pressing both BAND and MANUAL TUNING.

*3 Except for Saudi Arabia

*4 France, Germany, Switzerland, Scandinavian countries and Saudi Arabia

*5 Countries other than *4

When scanning stops too often

Set SENS to LOCAL.

1-6. PRESET TUNING

How to Preset a Station

- 1 Set POWER/LOCK to POWER.
- 2 Press ON/OFF.
- 3 Tune in a desired station.
- 4 Press one of the PRESET/DIRECT TUNING buttons while keeping ENTER pressed.
The desired station is stored on that button.

e.g. To preset FM 89.0 MHz on the button 1

Blinks while ENTER is pressed.

The number of the stations you can preset

Up to 10 FM and AM stations in total can be preset on the PRESET/DIRECT TUNING buttons. You can store only one station on each button.

1-7. HOW TO TUNE IN PRECISELY

This radio receives the station at the interval of frequency shown in the list on pages ①, ②. To receive a station whose frequency does not coincide with this interval, it is necessary to adjust the tuning in approx. ± 5 kHz range by FINE TUNING. In this case, the frequency display will not change.

- 1 Set the AM MODE selector to the appropriate position.

Position	Broadcast type
NORM	Fine tuning does not operate in this position
FINE	For LW/MW/SW reception (DSB, Double side band)
LSB* ¹	For ham and CW reception (below 10 MHz)
USB* ²	For ham and business radio reception (above 10 MHz)

*¹ Lower side band

*² Upper side band

- 2 Adjust the tuning with FINE TUNING.

+: For a frequency up to approx. 5 kHz higher
-: For a frequency up to approx. 5 kHz lower

To Tune in a Preset Station

- 1 Set POWER/LOCK to POWER.
- 2 Press ON/OFF.
- 3 Press a desired PRESET/DIRECT TUNING button.
The preset station will be tuned in.

To check the preset station

Press PRESET/DIRECT TUNING while pressing BAND. The frequency of the preset station is displayed. You can check anytime even if another station is tuned in.

To change the preset station

Store a station on a desired PRESET/DIRECT TUNING button. The station previously stored on the button is erased.

SSB (Single side band)

SSB is very popular among ham and business radio and will be found on all of the amateur bands because of its signal intelligibility. This results from that it transmits signals with half bandwidth of DSB (Double side band).

Typical AM (MW, LW, SW) band uses DSB. In DSB transmission, the amplitude of a carrier is modulated according to transmitted frequencies as shown below.

Audio signals are included both in USB and LSB. These signals included in USB and LSB are the same ones except that they are in the opposite phase relation.

This means that transmission can be done using only one of USB and LSB. SSB transmission is the system in which such a method is used. In general, SSB transmissions up to 10 MHz shall employ LSB modulation, and those above this frequency shall use USB. To receive SSB transmission, the unit with the BFO (Beat Frequency Oscillator) circuits is needed to convert SSB signals into audio signals. SSB cannot be heard with the radio which has no such circuits.

CW (Continuous wave)

CW is also popular among ham and business radio. In CW transmission, the amplitude of a carrier is not modulated while that of other systems is modulated. CW conveys information by interrupting a carrier using Morse code. It can be heard as a beat sound only with the unit equipped with the BFO circuits. To understand information transmitted by CW, you need to learn the Morse code.

SECTION 2

OUTLINE

2-1. OUTLINE OF THE C-MOS DIGITAL-TUNING SYSTEM IC201, μ PD1715G-558-22 OR μ PD1715G-569-22

2-1-1. OUTLINE OF THE STATION-SELECTION

1) Receiving-frequency Coverages and Scan Range

The following table shows the frequency coverages and scan range of μ PD1715G-558-22 or μ PD1715G-569-22 can receive.

BAND	SCAN RANGE	CHANNEL SEPARATION	NOMINAL SPACING
LW	150kHz — 285kHz	3kHz	3kHz
	150kHz — 528kHz		
MW	531kHz — 1611kHz	9kHz	3kHz
	530kHz — 1610kHz	10kHz	5kHz
SW	※1 1615kHz — 2245kHz	5kHz	5kHz
	2250kHz — 2550kHz	5kHz	5kHz
	3150kHz — 3450kHz	5kHz	5kHz
	3850kHz — 4050kHz	5kHz	5kHz
	4700kHz — 5100kHz	5kHz	5kHz
	5900kHz — 6250kHz	5kHz	5kHz
	7000kHz — 7400 kHz	5kHz	5kHz
	9400kHz — 10000kHz	5kHz	5kHz
	11500kHz — 12150kHz	5kHz	5kHz
	13500kHz — 13900kHz	5kHz	5kHz
	15000kHz — 15700 kHz	5kHz	5kHz
	17450kHz — 18000kHz	5kHz	5kHz
	21400kHz — 21950kHz	5kHz	5kHz
	25600kHz — 26100 kHz	5kHz	5kHz
	※2 26105kHz — 29995 kHz	5kHz	5kHz
FM	76.00MHz — 108.00MHz	100kHz	12.5kHz
	87.50MHz — 108.00MHz	50kHz	12.5kHz

Note: Either direct or manual selection is feasible for ※1 frequency range or meter band, but BAND SELECT key is inoperative. Able to scan.
※2 range, but unable to receive during in up/down mode.

2) Station-selecting Functions:

- Selection with 10 key.
- Manual up/down selection with up/down key.
- Random selection out of the preset memories by key-in calling.
Total 10 stations.
- Scanning selection.
- Last channel memory.

2-1-2. DESCRIPTION ON THE TERMINALS

1) Terminal Arrangement

2) IC201 (μPD1715G) Pin Functions

PIN No.	SYMBOL	NAMING	DESCRIPTION
1 10	LCD9 LCD1	LCD SEGMENT SIGNALS	Transmit the segment-output signals to the LCD panel. When matrixes are configured together with the COM1 thru COM3, a display of 48 dots can be made. These output signals are output when the LCDD commands are made. The LCD-driving voltages are of 3.1V typical, 1/2 bias and 1/3 duty when the frame frequency is 100 Hz. These LCD11 through LCD16 can also be used at the same as the key source signals for the key matrix. These signal are output on time-division bases, and they are output as the key-source signals at the repetition rate of 6.7 msec. Whether the key-source signal are to be output while having displays on the panel is dependent upon and selectable by the programs used. These terminals become automatically in the “L” (low) state, i.e., non-display mode, at the power-on reset (VDD changes from low to high state) and at the stoppage moment of the clock. The display mode does not change at the reset moment in which CE changes from low to high state.
11 13	COM3 COM1	LCD COMMON SIGNAL	Transmit common signals to the LCD panel. When the matrixes are configured together with the LCD1 through LCD16, a display of 48 dots can be made. Three distinctive signals of VSS3, VSS2 and VDD are output through these terminals at the repetition rate of 50 Hz. These terminals become automatically in the “L” (low) state, i.e., non-display mode, at the power-on reset (VDD changes from low to high state) and at the stoppage moment of the clock.
14 15 16 17	VSS3 CAP2 CAP1 VSS2	CAPACITOR CONNECTION TERMINAL FOR DOUBLER	Capacitor-connection terminals to make a proper voltage doubler to build the 3.1V typical LCD-driving voltage VDD. Normal circuit configuration is as follows. 
18	PG2 (VDP)	VARIABLE DUTY PORT	Outputs the variable-duty or the one-bit (PG2) signal. Not used.
19	PD3 (CGP) MUTE	CLOCK GENERATOR PORT (MUTE SIGNAL)	Outputs the clock-generator or the one-bit (PD3) signal. The selection of either of them is programmable. When used as the CGP, this terminal can transmit the pulse chain of 1 kHz of 46.6% duty or 3 kHz of 60% duty. Outputs signal to cut noise between frequency change due to key input and PLL lock, Low level output actuates mute.
20	VDD	INPUT OF POWER SUPPLY VOLTAGE	Receives the power-supply voltage for this device. In operation, a voltage of 2.0 to 3.5 VDC is applied to this terminal. The input voltage can be lowered down to 1.5 VDC when any of the internal data in the RAM, i.e., when the CKSTP command is under execution, is to be holded. The power-on reset circuit of device starts to operate at the instance this terminal receives a voltage of 0 (zero) to 1.7 VDC, and the program starts from the location 0 (zero). Note: This pin and pin 46 are connected internally. So, it is not necessary to apply the power-supply voltage to both of them. The ceramic-packaged device, however, has a not-to-be connected pin 46, i.e., N.C. terminal.

PIN NO.	SYMBOL	NAMING	DESCRIPTION												
21	M	CONTROL-SIGNAL INPUT FOR DIVIDER	Determines the dividing ratio of the fixed-division prescaler. A 1/4 dividing ratio is made when this terminal is held at "H" (high), and a 1/2 divider is made when held at "L" (low). This port is used only when the VCOH terminal (FM in this set) i.e., pin 22 is used. This set uses this port as a 1/4 divider for FM and 1/2 divider for AM.												
22	VCOH	OSC SIGNAL INPUT	Inputs 1/4 divider 10 ~ 130 MHz (0.1 Vp-p MIN.) or 1/2 divider 10 ~ 100 MHz (0.1 Vp-p MIN.) of local-oscillator output, i.e., the VCO output. This input signal is connected internally in this device through the 1/2 fixed-divider prescaler or the 1/4 fixed-divider prescaler and through the two-module prescaler composed of 1/32 and 1/33 frequency dividers to the internal programmable counter. This terminal is pulled down to the ground level when the direct frequency-dividing system is taken into the circuit or when the Pulse-Swallow system is used with the HF command executed, i.e., the VCOL (AM) terminal is selected. A capacitor coupling is needed due to the inclusion of alternate current amplifiers inside this device.												
	VCOL		Receives an AM local-oscillator signals, i.e., the VCO signal from 0.5 MHz to 40 MHz of 0.2 Vp-p minimum. This port is selected when the direct frequency-dividing system or the Pulse-Swallow system is used and, at the same time, the HF command is executed. These two systems are, however, different one another as shown below. <table border="1"> <thead> <tr> <th>DIVIDING SYSTEM</th><th>INPUT LEVEL (MINIMUM)</th><th>INPUT FREQUENCY</th><th>DIVIDING RATIO</th></tr> </thead> <tbody> <tr> <td>DIRECT</td><td>0.1 Vp-p</td><td>0.5 to 15 MHz</td><td>16 to $(2^{12}-1)$</td></tr> <tr> <td>PULSE-SWALLOW (HF COMMAND EXECUTED)</td><td>0.2 Vp-p</td><td>0.5 to 40 MHz</td><td>1,024 to $(2^{17}-1)$</td></tr> </tbody> </table> This terminal is pulled down to the ground level when the Pulse-Swallow system is used together with the VHF-command execution, i.e., the VCOH (FM) terminal is selected. A capacitor coupling is needed due to the inclusion of alternate current amplifiers inside this chip. Not used.	DIVIDING SYSTEM	INPUT LEVEL (MINIMUM)	INPUT FREQUENCY	DIVIDING RATIO	DIRECT	0.1 Vp-p	0.5 to 15 MHz	16 to $(2^{12}-1)$	PULSE-SWALLOW (HF COMMAND EXECUTED)	0.2 Vp-p	0.5 to 40 MHz	1,024 to $(2^{17}-1)$
DIVIDING SYSTEM	INPUT LEVEL (MINIMUM)	INPUT FREQUENCY	DIVIDING RATIO												
DIRECT	0.1 Vp-p	0.5 to 15 MHz	16 to $(2^{12}-1)$												
PULSE-SWALLOW (HF COMMAND EXECUTED)	0.2 Vp-p	0.5 to 40 MHz	1,024 to $(2^{17}-1)$												
24	Vssl	GROUND	The ground-return terminal of this device.												
25 26	E01 E02	ERROR OUTPUT ERROR OUTPUT	Transmits the error signal of the PLL system. When the resultant frequencies obtained by dividing the local-oscillator frequencies are higher than the reference frequency, an "H" (high)-level signal is output from this port. When these are lower, on the contrary, an "L" (low)-level signal is output from this port. When these divided frequencies just coincide with the reference frequency, this port becomes in a floating state. These output signals from this port then go through the external lowpass filter to the varactor diodes in the turned circuits in these frontends of the receiver. The same output waveform as the terminal E01 is obtainable from the next terminal E02, pin 26, and so these two are user-selectable. When the PLL is disabled, i.e., when the system is set by the PLL commands or the CE terminal, pin 27, is set to the "L" (low)-level, these E01 and E02 terminals become in the floating states.												
27	CE	CHIP ENABLE	Receives the state-selection signals for this device. When set a "H" (high), this device works, and vice versa. The PLL section of this device becomes forcibly in a disabled condition in the duration of wider than 140 μ sec of the "L" (low)-level state. The duration, however, of shorter than 140 μ sec is not taken into account. The programmes are using the CKSTP commands. The CKSTP commands are effective only when the state of this CE is in an "L" (low) condition. When this CE terminal is in an "H" state, these programmes work like under NOP commands. When the CKSTP commands are executed when this CE terminal is in an "L" (low) level, the internal clock generator and the internal CPU are disabled. In this disabled condition, the RAM-memory backupings can be made under a very-low current consumption of 3 μ A maximum. In this condition, these display-output signals LCD1 through LCD16 and the COM1 COM3 become in the off-display mode, i.e., the "L" (low) state. When the level of this CE terminal is changed from "L" to "H", this device is reset and its programmes start from the location "0" (zero). In this state, the Port A becomes in the input mode. Goes to "L" (low) when main power switch is OFF or when the power supply is below 1.9V (1.8 ~ 2.0 V).												

PIN NO.	SYMBOL	NAMING	DESCRIPTION															
28 29	XO X1	CRYSTAL OSCILLATOR	An external quartz-crystal oscillator connects to these terminals to obtain 75 kHz signal generator for the devices.															
30 33	PA3 PA0	PORT A	4-bit I/O (Input/Output) ports. These ports enable the device designate input or output bit by bit. The each designation is, in turn, performed by the contents in the location "1FH" in the "BANK 0 (zero)" in the data memory (RAM), called as a "PAIO word". At these instances as the power-on, clock stoppage and the initial setting of the CE terminal from "L" to "H", these terminals automatically become in the input ports. Under the port-operation commands like "IN", "OUT", "SPB", "RPB" commands, etc., the PA0 port coincides with the least significant bit of the register or the operand, the PA3 coincides with the most-significant bit of them. The same applies to the port B and Port C respectively.															
(30) (31) (32) (33)	PA3 (SD) PA2 PA1 PA0	PORT A PORT A PORT A PORT A	When receiving a broadcast station, it goes to "H" (high), and tuning LED lights. It is used as a stop signal for scan function. Initial key input port. Mode output. <table><tr><td></td><td>RADIO OFF</td><td>LW/MW</td><td>SW</td><td>FM</td></tr><tr><td>PA1</td><td>"L"</td><td>"L"</td><td>"H"</td><td>"H"</td></tr><tr><td>PA0</td><td>"L"</td><td>"H"</td><td>"L"</td><td>"H"</td></tr></table>		RADIO OFF	LW/MW	SW	FM	PA1	"L"	"L"	"H"	"H"	PA0	"L"	"H"	"L"	"H"
	RADIO OFF	LW/MW	SW	FM														
PA1	"L"	"L"	"H"	"H"														
PA0	"L"	"H"	"L"	"H"														
34 37	PB3 PB0	PORT B	4-bit exclusive output ports. For ports PB0 and PB1, the sink current is minimized to a specially-low drain, so the PB0 and PB1 are able to be used as the return-signal sources for the key matrix. Accordingly, any of the reverse-current-preventive diodes can be eliminated when these PB0 and PB1 ports are used as the key-return-signal sources. When these ports are used as ordinal output ports, it will happen any of the low-level output signal will not be output properly depending upon the circuit employed, because of the low sink current. In these cases, pull-down resistors are used in these output lines. Under the port-operation commands like "IN", "OUT", "SOB", "RPB" commands, etc., the PA0 port coincides with the least significant bit of the register or the operand, the PA3 coincides with the most-significant bit of them. The same applies to the Port B and Port C respectively. These exclusive output ports should be initialized using the programmes, because these ports output unstable and undefined output signals at the initial power-on condition, i.e., from "L" to "H". The output-data contents are the same as these previous last ones when the CE terminal changes from "L" to "H" or from "H" to "L", and when the CKSTP commands are under execution. Accordingly, the initialization with programmes is needed too where required. In this set, these ports are used as those shown in the parentheses.															
(34) (35) (36) (37)	PB3 (3 kHz) PB2 (5 kHz) PB1 PB0	PORT B PORT B PORT B PORT B	First local frequency control: In LW and MW (in 9 kHz step), if 3 is left when the receiving frequency divided by 6, it outputs "L" (low). If divisible by 6, outputs "H" (high). First local frequency control: In MW (in 10 kHz step) and SW, if 5 is left when the receiving frequency divided by 10, it outputs "L" (low). If divisible by 10, outputs "H" (high). Key matrix key sources signal.															
38 40	PC3 PC1	PORT C (KEY- MATRIX SIGNAL- SOURCE OUTPUT)	Refer to the PORT B outlined above. All the ports of this PORT C apply to the description for the PORT B. In this set, these ports output signals to be used as the signal sources for the key matrix.															
41	NC	NO	This is a free terminal and is not connected to the internal circuits, and this terminal can be used as a junction land.															
42	PC0	PORT C	Refer to description for pins 38 through 40 outlined above.															
43 45	K3 K1	KEY INPUTS	4-bit exclusive input ports. These are normally used as the key-matrix input terminals. When the KIN or the KI commands executed, the conditions of these pins are read into the RAM data memories designated by the operand portion of these commands.															
46	VDD		Same as pin 20.															
47	K0		Same as pins 43 through 45.															
48 53	LCD16 LCD11		Same as pins 1 through 10.															
54	NC		Same as pin 41.															

2-1-3. INITIAL-STATE SETTING

1) Initial Power-on Setting:

VDD = 0 V → 3.0 V, CE = Low → High

The power-supply is reset after performing the initial power-on setting, and the following operations are made.

- The power-out terminal becomes in “L” (low) state, i.e., power off, and reads the initial-state setting diodes.
- Initializes the preset-memories contents of each figures from 0 to 9 to its 150 kHz frequency.
- Initializes the last-channel memories contents of the above each cases to its 150 kHz frequency.
- Sets the clock and alarm time to “0:00”, and resets the “second” starting.
- And the LCD displays the following clock display.

2) Backup Condition:

CE = Low

The backup state is made when the CE terminal becomes in “L” (low) state. In the backup state, the program routines are intermittently performed to eliminate the current drain by using the “HALT” command. The operation routine is as follows.

- The PLL is disabled.
- All the ports are made into “L” (low) state.
- LCD displays remains only for the clock display.

Note: The same operations are made in the radio-off state when CE is “H” (high).

2-1-4. MUTING-OUTPUT TIMINGS

1) MUTE-OUTPUT

- Allowance for key-on chattering (approx. 15msec).
- Range check, N count, and PLL DATA output.

MUTE: Mute mode at low level.

a) RADIO ON

b) RADIO OFF

c) Preset selection, Direct selection, Band switching (Band UP/DOWN, manual selection).

d) Continual band UP/DOWN

e) Continual frequency UP/DOWN (manual selection)

- In the same band

f) Scan selection

2) DISPLAY FLICKER PERIOD

a) Time/Alarm set flicker

b) TRY AGAIN! Memory write # flicker.

2-1-5. SEGMENTS AND COMMONS OF LIQUID-CRYSTAL DISPLAY PANEL (LCD201)

2-1-6. RELATIONSHIP OF LCD (LCD201) SEGMENTS TO LSI PINS

SECTION 3 DISASSEMBLY

Note: Follow the disassembly procedure in the numerical order given.

REAR CABINET

SECTION 4 ELECTRICAL ADJUSTMENTS

Preparation

How to turn the power ON/OFF.

1. Press down portion ① of S223 (Power Lock) switch by adhesive tape.
2. Push the S216 (ON/OFF) switch.

Adjustment Location:

[MAIN BOARD (SIDE A)]

Test Point Location:

[MAIN BOARD (SIDE B)]

• AM SECTION

2nd LOCAL ADJUSTMENT/3 kHz STEP/5 kHz STEP ADJUSTMENT

Setup:

VOLUME control: as required
AM Mode: NORMAL

Procedure:

- 2nd LOCAL ADJUSTMENT
 1. Tune the set to AM 153 kHz.
 2. Adjust T7 to obtain a 55.38995 – 55.39005 MHz on the frequency counter.
- 3 kHz STEP ADJUSTMENT
 3. Tune the set to AM 156 kHz
 4. Adjust RV3 to obtain a 55.38695 – 55.38705 MHz on the frequency counter.
- 5 kHz STEP ADJUSTMENT
 5. Tune the set to AM 5,000 kHz.
 6. Adjust RV2 to obtain a 55.38495 – 55.38505 MHz on the frequency counter.

1st/2nd IF ADJUSTMENT

Setup:

VOLUME control: as required
AM Mode: NORMAL
SENS: DX

Procedure:

- 1st IF ADJUSTMENT
 1. Set the frequencies of the AM RF SSG and the frequency display of the set to 156 kHz.
 2. Adjust T3 and T4 to obtain a maximum reading on the VTVM.
- 2nd IF ADJUSTMENT
 1. Set the frequencies of the AM RF SSG and the frequency display of the set to 156 kHz.
 2. Adjust T5 to obtain a maximum reading on the VTVM.

• FM SECTION

FM VCO VOLTAGE ADJUSTMENT

Setup:

VOLUME control: as required

Procedure:

1. Tune the set to 108 MHz.
2. Adjust T10 to obtain a 12.4 – 12.6 V on the VTVM.

FM RF ADJUSTMENT

Setup:

VOLUME control: as required
SENS: DX

Procedure:

1. Set the frequencies of the FM RF SSG and the frequency display of the set to 108 MHz.
2. Adjust CT2 and CT1 to obtain a maximum reading on the VTVM.
3. Set the frequencies of the FM RF SSG and the frequency display of the set to 76 MHz.
4. Adjust T8 and T9 to obtain a maximum reading on the VTVM.
5. Repeat the above steps several times.

FM STEREO ADJUSTMENT

Setup:

VOLUME control: as required

Procedure:

1. Insert HEADPHONES plug into HEADPHONES jack.
2. Connect a capacitor (10μF) between pin 21 of IC1 and GRAND.
3. Set frequency display of the set to 98 MHz.
4. Adjust RV4 to obtain 75.9 – 76.1 kHz on the frequency counter.

SECTION 7

ELECTRICAL PARTS LIST

NOTE:

- Due to standardization, replacements in the parts list may be different from the parts specified in the diagrams or the components used on the set.
- Items marked "★" are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.
- If there are two or more same circuits in a set such as a stereophonic machine, only typical circuit parts may be indicated and capacitors and resistors in other same circuits may be omitted.

CAPACITORS:

MF: μF , PF: $\mu\mu F$.

RESISTORS

- All resistors are in ohms.
- F: nonflammable

COILS

- MMH: mH, UH: μH

SEMICONDUCTORS

In each case, U: μ , for example:

UA....: μA ..., UPA....: μPA ...,

UPC....: μPC , UPD....: μPD ...

The components identified by mark Δ or dotted line with mark Δ are critical for safety. Replace only with part number specified.

Les composants identifiés par une marque Δ sont critiques pour la sécurité.

Ne les remplacer que par une pièce portant le numéro spécifié.
