

Features

- **ENHANCEMENTS**
 - ispLSI 2128A is Fully Form and Function Compatible to the ispLSI 2128, with Identical Timing Specifications and Packaging
 - ispLSI 2128A is Built on an Advanced 0.35 Micron E²CMOS[®] Technology
- **HIGH DENSITY PROGRAMMABLE LOGIC**
 - 6000 PLD Gates
 - 128 I/O Pins, Eight Dedicated Inputs
 - 128 Registers
 - High Speed Global Interconnect
 - Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.
 - Small Logic Block Size for Random Logic
- **HIGH PERFORMANCE E²CMOS[®] TECHNOLOGY**
 - $f_{max} = 100$ MHz Maximum Operating Frequency
 - $t_{pd} = 10$ ns Propagation Delay
 - TTL Compatible Inputs and Outputs
 - Electrically Erasable and Reprogrammable
 - Non-Volatile
 - 100% Tested at Time of Manufacture
 - Unused Product Term Shutdown Saves Power
- **IN-SYSTEM PROGRAMMABLE**
 - In-System Programmable (ISP[™]) 5V Only
 - Increased Manufacturing Yields, Reduced Time-to-Market and Improved Product Quality
 - Reprogram Soldered Devices for Faster Prototyping
- **OFFERS THE EASE OF USE AND FAST SYSTEM SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FIELD PROGRAMMABLE GATE ARRAYS**
 - Complete Programmable Device Can Combine Glue Logic and Structured Designs
 - Enhanced Pin Locking Capability
 - Three Dedicated Clock Input Pins
 - Synchronous and Asynchronous Clocks
 - Programmable Output Slew Rate Control to Minimize Switching Noise
 - Flexible Pin Placement
 - Optimized Global Routing Pool Provides Global Interconnectivity
 - Lead-Free Package Options

Functional Block Diagram

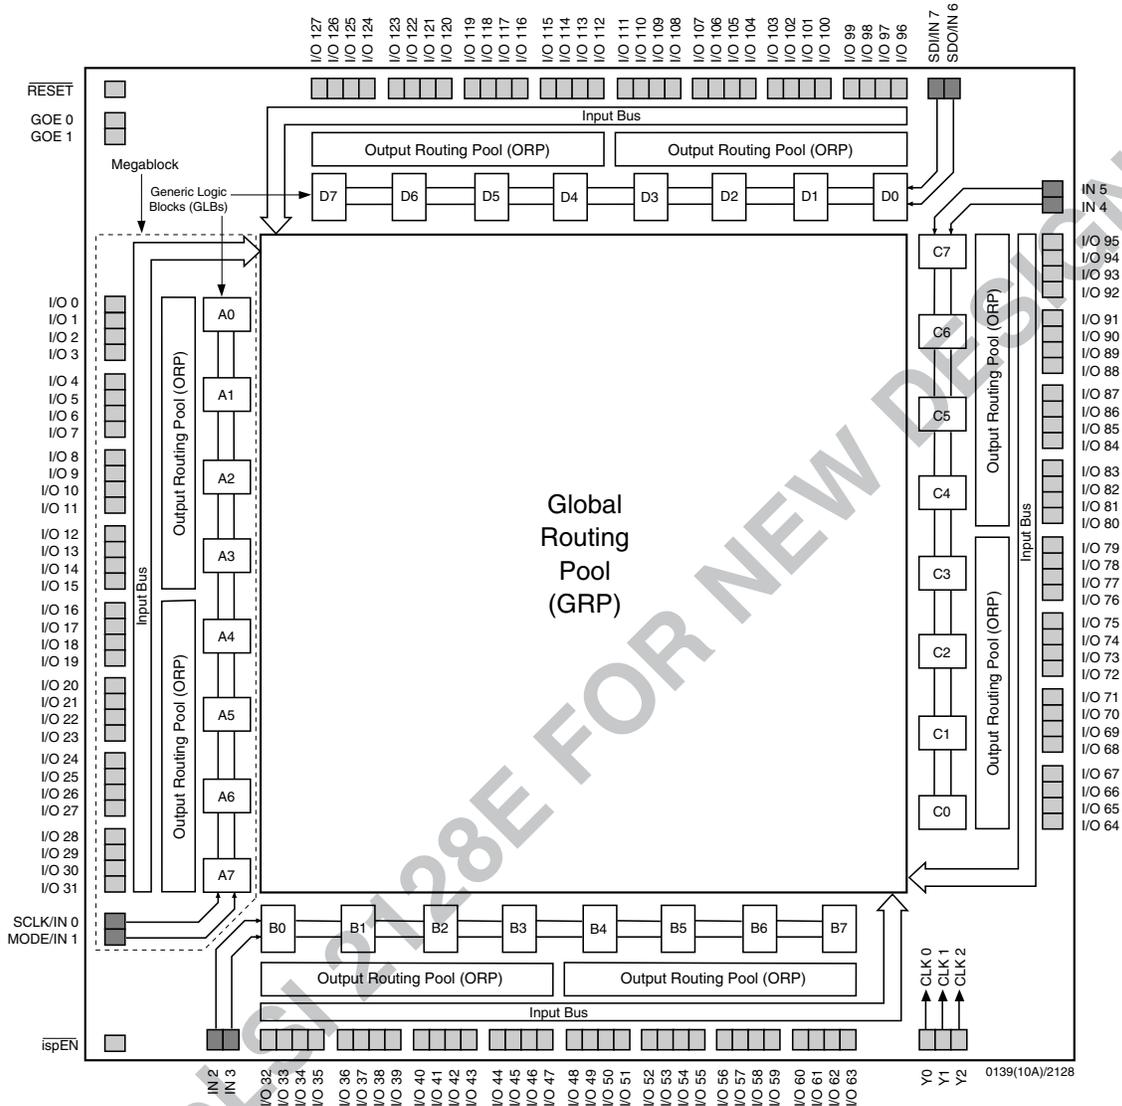

Description

The ispLSI 2128 and 2128A are High Density Programmable Logic Devices. The devices contains 128 Registers, 128 Universal I/O pins, eight Dedicated Input pins, three Dedicated Clock Input pins, two dedicated Global OE input pins and a Global Routing Pool (GRP). The GRP provides complete interconnectivity between all of these elements. The ispLSI 2128 and 2128A feature 5V in-system programmability and in-system diagnostic capabilities. The ispLSI 2128 and 2128A offer non-volatile reprogrammability of the logic, as well as the interconnect to provide truly reconfigurable systems.

The basic unit of logic on these devices is the Generic Logic Block (GLB). The GLBs are labeled A0, A1 .. D7 (Figure 1). There are a total of 32 GLBs in the ispLSI 2128 and 2128A devices. Each GLB is made up of four macrocells. Each GLB has 18 inputs, a programmable AND/OR/Exclusive OR array, and four outputs which can be configured to be either combinatorial or registered. Inputs to the GLB come from the GRP and dedicated inputs. All of the GLB outputs are brought back into the GRP so that they can be connected to the inputs of any GLB on the device.

Functional Block Diagram

Figure 1. ispLSI 2128/A Functional Block Diagram

The device also has 128 I/O cells, each of which is directly connected to an I/O pin. Each I/O cell can be individually programmed to be a combinatorial input, output or bi-directional I/O pin with 3-state control. The signal levels are TTL compatible voltages and the output drivers can source 4 mA or sink 8 mA. Each output can be programmed independently for fast or slow output slew rate to minimize overall output switching noise.

Eight GLBs, 32 I/O cells, two dedicated inputs and two ORPs are connected together to make a Megablock (Figure 1). The outputs of the eight GLBs are connected to a set of 32 universal I/O cells by the two ORPs. Each ispLSI 2128 and 2128A device contains four Megablocks.

The GRP has as its inputs, the outputs from all of the GLBs and all of the inputs from the bi-directional I/O cells. All of these signals are made available to the inputs of the GLBs. Delays through the GRP have been equalized to minimize timing skew.

Clocks in the ispLSI 2128 and 2128A devices are selected using the dedicated clock pins. Three dedicated clock pins (Y0, Y1, Y2) or an asynchronous clock can be selected on a GLB basis. The asynchronous or Product Term clock can be generated in any GLB for its own clock.

Absolute Maximum Ratings ¹

Supply Voltage V_{CC} -0.5 to +7.0V
 Input Voltage Applied..... -2.5 to $V_{CC} + 1.0V$
 Off-State Output Voltage Applied -2.5 to $V_{CC} + 1.0V$
 Storage Temperature -65 to 150°C
 Case Temp. with Power Applied -55 to 125°C
 Max. Junction Temp. (T_J) with Power Applied ... 150°C

1. Stresses above those listed under the “Absolute Maximum Ratings” may cause permanent damage to the device. Functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).

DC Recommended Operating Condition

| SYMBOL | PARAMETER | | MIN. | MAX. | UNITS |
|----------|--------------------|--|------|--------------|-------|
| V_{CC} | Supply Voltage | Commercial $T_A = 0^\circ C$ to $+ 70^\circ C$ | 4.75 | 5.25 | V |
| | | Industrial $T_A = -40^\circ C$ to $+ 85^\circ C$ | 4.5 | 5.5 | V |
| V_{IL} | Input Low Voltage | | 0 | 0.8 | V |
| V_{IH} | Input High Voltage | | 2.0 | $V_{CC} + 1$ | V |

Table 2 - 0005/2128

Capacitance ($T_A = 25^\circ C$, $f = 1.0$ MHz)

| SYMBOL | PARAMETER | TYPICAL | UNITS | TEST CONDITIONS |
|--------|-------------------------------------|---------|-------|--|
| C_1 | I/O and Dedicated Input Capacitance | 8 | pf | $V_{CC} = 5.0V$, $V_{I/O, IN} = 2.0V$ |
| C_2 | Clock Capacitance | 15 | pf | $V_{CC} = 5.0V$, $V_Y = 2.0V$ |

DC Electrical Characteristics

Over Recommended Operating Conditions

| SYMBOL | PARAMETER | CONDITION | MIN. | TYP. ³ | MAX. | UNITS | |
|----------------|-----------------------------------|---|------------|-------------------|------|-------|----|
| V_{OL} | Output Low Voltage | $I_{OL} = 8 \text{ mA}$ | – | – | 0.4 | V | |
| V_{OH} | Output High Voltage | $I_{OH} = -4 \text{ mA}$ | 2.4 | – | – | V | |
| I_{IL} | Input or I/O Low Leakage Current | $0V \leq V_{IN} \leq V_{IL} (\text{Max.})$ | – | – | -10 | μA | |
| I_{IH} | Input or I/O High Leakage Current | $3.5V \leq V_{IN} \leq V_{CC}$ | – | – | 10 | μA | |
| I_{IL-isp} | ispEN Input Low Leakage Current | $0V \leq V_{IN} \leq V_{IL}$ | – | – | -150 | μA | |
| I_{IL-PU} | I/O Active Pull-Up Current | $0V \leq V_{IN} \leq V_{IL}$ | – | – | -150 | μA | |
| I_{OS}^1 | Output Short Circuit Current | $V_{CC} = 5V, V_{OUT} = 0.5V$ | – | – | -200 | mA | |
| $I_{CC}^{2,4}$ | Operating Power Supply Current | $V_{IL} = 0.0V, V_{IH} = 3.0V$ $f_{CLOCK} = 1 \text{ MHz}$ | Commercial | – | 165 | 325 | mA |
| | | Industrial | – | 165 | – | mA | |

Table 2-0007/2128

- One output at a time for a maximum duration of one second. $V_{OUT} = 0.5V$ was selected to avoid test problems by tester ground degradation. Characterized but not 100% tested.
- Measured using eight 16-bit counters.
- Typical values are at $V_{CC} = 5V$ and $T_A = 25^\circ C$.
- Maximum I_{CC} varies widely with specific device configuration and operating frequency. Refer to the Power Consumption section of this data sheet and the Thermal Management section of the Lattice Semiconductor Data Book or CD-ROM to estimate maximum I_{CC} .

 &= (\#20 + \#22 + \#35) + (\#31) + (\#36 + \#38) \\
 12.6 \text{ ns} &= (0.5 + 1.7 + 7.1) + (0.3) + (1.4 + 1.6)
 \end{aligned}$$

Table 2-0042/2128

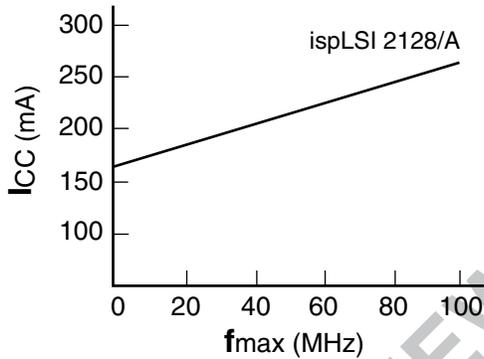

Note: Calculations are based upon timing specifications for the ispLSI 2128/A-100L.

Power Consumption

Power consumption in the ispLSI 2128 and 2128A devices depends on two primary factors: the speed at which the device is operating and the number of Product Terms

used. Figure 4 shows the relationship between power and operating speed.

Figure 4. Typical Device Power Consumption vs fmax

Notes: Configuration of eight 16-bit counters
Typical current at 5V, 25° C

ICC can be estimated for the ispLSI 2128/A using the following equation:

$$I_{CC} \text{ (mA)} = 20 + (\# \text{ of PTs} * 0.48) + (\# \text{ of nets} * \text{Max freq} * 0.009)$$

Where:

- # of PTs = Number of Product Terms used in design
- # of nets = Number of Signals used in device
- Max freq = Highest Clock Frequency to the device (in MHz)

The ICC estimate is based on typical conditions (VCC = 5.0V, room temperature) and an assumption of two GLB loads on average exists. These values are for estimates only. Since the value of ICC is sensitive to operating conditions and the program in the device, the actual ICC should be verified.
