

蛍光表示管製品規格

VACUUM FLUORESCENT DISPLAY SPECIFICATION

双葉電子工業株式会社

電子部品事業部 電子管技術グループ
ENGINEERING GROUP, ELECTRON TUBE
ELECTRONIC COMPONENTS DIVISION
FUTABA CORPORATION

形名 Type No. 16-BT-131INK

用途 : Application SET TOP BOX
外形寸法 : Outer Dimension 118.2 (L) × 20.5 (W) × 5.9 (T) mm
Cdium Free Phosphor, Lead Free Solder
発光色 : Color of Illumination Green (G. x=0.24,y=0.41)
Red (R. x=0.67,y=0.33)

絶対最大定格: Absolute Maximum Rating

項目	Item	Symbol	Terminals	Rating	Unit
フィラメント電圧 : Filament Voltage		Ef	F+-F-	4.8	Vdc
ロジック電源電圧 : Logic Supply Voltage	*2	VDD	VDD	- 0.3 ~ 6.0	Vdc
ドライバ電源電圧 : Driver Supply Voltage	*3	VH	VH	- 0.3 ~ 37	Vdc
ロジック信号入力電圧 : Logic Input Voltage		VIN	SI,CLK,LAT,BK	- 0.3 ~ VDD+0.3	Vdc
保存温度 : Storage Temperature		Tstg	-	-55 ~ +80	

絶対最大定格: 瞬時たりとも超えてはならない規格であり、此れを超えた場合恒久的な機能障害を発生する可能性があります。

Absolute Maximum Condition : The value shall not be exceeded in any conditions. Permanent damage to VFD may be expected.

推奨動作条件: Recommended Operating Condition

項目	Item	Symbol	Min.	Typ.	Max.	Unit
フィラメント電圧 : Filament Voltage	*1	Ef	3.60	4.0	4.40	Vdc
ドライバ電源電圧 : Driver Supply Voltage	*3	VH	28	31	34	Vdc
ロジック電源電圧 : Logic Supply Voltage	*2	VDD	4.5	5.0	5.5	Vdc
Hレベル入力電圧 : H-Level Input Voltage		VIH	VDD × 0.8	-	VDD	Vdc
Lレベル入力電圧 : L-Level Input Voltage		VIL	0	-	VDD × 0.2	Vdc
カットオフバイアス : Cut-off Bias	*1	Ek	2.0	-	3.0	Vdc
動作温度 : Operating Temperature		Topr	-20	-	+70	°C

内部クロック動作特性: Characteristics of Internal Clock Circuit

項目	Item	Symbol	条件: Condition	Typ.	Unit
自己発信周波数 : Internal Clock Frequency		f _{OSC}	V _{DD} =5.0V	4.8	MHz
表示フレーム周波数 : Display Frame Frequency		f _{FR}	R _{OSC} =33kΩ	361	Hz

推奨動作条件: 信頼性、品質を確保できる範囲(寿命はTyp.値が最適値です。)

Recommended Operating Condition: Quality and reliability can be assured in this condition.

(Typ.condition is the most optimized value on the life time.)

*1 フィラメントの極性のマイナス側に印加する。

Ek is applied to the minus polarity of the filament.

*2 電源シーケンス Power Supply Sequence

VHを印加中はVDDを4.5 ~ 5.5Vの間でご使用下さい。

VDD should be 4.5 to 5.5V when applying VH.

電源投入時はVDDとVHを同時、またはVDDを投入した後にVHを投入下さい。

VH and VDD should be on at the same, or VH should be on after VDD is on.

電源遮断時はVDDとVHを同時、またはVHを遮断した後にVDDを遮断下さい。

VH and VDD should be off at the same, or VDD should be off after VH is off.

*3 VHを印加中は推奨動作条件でご使用下さい。 Recommended Operating Condition should be used when applying VH.

本製品は半導体製品ですので静電気のお取り扱いには十分ご注意ください。

The VFD is built with C-MOS lcs. Precautions should be taken to minimize the possibility of static charges.

本規格と異なる使い方をされる場合、品質、信頼性を確保出来ない場合がありますので事前にご相談下さい。

Since deviation from this specification may generate quality or reliability concerns, please consult to FUTABA prior to use.

この仕様書の内容はお断りなく変更することがありますのでご了承下さい。

This specification is subject to change without notice.

電気的特性:Electrical Characteristics

指定がない場合は、推奨動作条例のTyp値、全点灯、 $f_{CLK}=5\text{MHz}$ 、 $\text{PGND}=\text{LGND}=0\text{V}$ とする。

Unless otherwise specified, The test condition should be Typ value of recommended condition and all segments on,
 $f_{CLK}=5\text{MHz}$, $\text{PGND}=\text{LGND}=0\text{V}$.

STAND-BY MODE SET	1	1	1	0	1	1	*	ST	Command not needed								

* : arbitrary

Xn: To set the address for display timing, n= 0 to 4

Cn: To set the character code of CGRAM/CGROM, n= 0 to 7

Sn: Sn=1: is used as the Grid pin, Sn=0: is used as the Segment pin

Yn: To set the CGRAM address, n= 0 to 2

Dn: To set the CGRAM character code, n= 0 to 34

En: To set ON/OFF of S1 ~ S6 outputs, n= 0 to 5

Un: To set the URAM address, n= 0 to 2

Fn: To set display timing, n= 0 to 6

Hn: To set the value for dimming, n= 0 to 7

Jn: To set the address of the gray scale register, n= 0 to 2

In: To set the data for the gray scale level, n= 0 to 7

Kn: To set Enable/Disable of the gray scale level, n= 0 and 2 to 7

HS: To set to all lights ON, HS=1: all lights ON (all segments at H) HS=0: normal lighting mode

*The type isn't used in all lights ON.

LS: To set to all lights OFF, LS=1: all lights OFF (all segments at L) LS=0: normal lighting mode

ST: To set the stand-by mode, ST=1: stand-by mode HS=0: normal operating mode

In case of continuous data write-in to RAM (DCRAM, CGRAM, ADRAM, etc.), it is not necessary to specify the first byte of the second and later bytes, because the addresses are automatically incremented internally.

Note: There is no guarantee for any operation resulted from the setting using other commands listed above.

2 Description of commands

2.1 DCRAM data write command

The DCRAM (data control RAM) has a 5-bit address to store the character codes of the CGROM and the CGRAM. The character codes specified by the DCRAM are converted into the character pattern of 5x7 dot matrix via the CGROM or the CGRAM. To write-in the DCRAM, specify the DCRAM address and write-in the character codes of the CGROM and the CGRAM. For the setting relationship of the DCRAM address to the display timing, refer to section 2.4, Display timing set command. The command format is shown below.

【Command Format】

	MSB	B7	B6	B5	B4	B3	B2	B1	LSB	B0
1st byte (1st)		0	0	1	X4	X3	X2	X1	X0	
2nd byte (2nd)	MSB	B7	B6	B5	B4	B3	B2	B1	LSB	B0
		C7	C6	C5	C4	C3	C2	C1		C0

The DCRAM data write mode is selected and the DCRAM address is specified.

(Ex. The DCRAM address 0H is specified.)

The CGROM and CGRAM character codes are specified. (The specified character codes are written into the DCRAM address 00H.)

- To continuously specify the CGROM and CGRAM character codes, specify character codes only as shown below. As the DCRAM addresses are automatically incremented, it is not necessary to specify the first byte. Addresses are specified from 00H to 17H incrementing 1 by 1. It is possible to continuously transfer up to 24 addresses.

3rd byte (3rd)	MSB	B7	B6	B5	B4	B3	B2	B1	LSB	B0
		C7	C6	C5	C4	C3	C2	C1		C0
4th byte (4th)	MSB	B7	B6	B5	B4	B3	B2	B1	LSB	B0
		C7	C6	C5	C4	C3	C2	C1		C0
⋮										
25th byte (25th)	MSB	B7	B6	B5	B4	B3	B2	B1	LSB	B0
		C7	C6	C5	C4	C3	C2	C1		C0

The CGROM and CGRAM character codes are specified.

(The data are written into the DCRAM address 01H.)

The CGROM and CGRAM character codes are specified.
(The data are written into the DCRAM address 02H.)

The CGROM and CGRAM character codes are specified.
(The data are written into the DCRAM address 17H.)

X0(LSB) ~ X4(MSB): DCRAM address (5 bits: 24 characters)

C0(LSB) ~ C7(MSB): CGROM and CGRAM codes (8 bits: 256 characters)

2.2 DISPLAY MODE SETTING COMMAND

The Display Mode Setting Command is used to set S1/G22, S2/G21, S3/G20, S4/G19, S5/G18, and S6/G17 as the Grid pin or the segment pin. The Display Mode Setting Command Format is shown below.

【Command Format】

1st byte (1st)	MSB	B7	B6	B5	B4	B3	B2	B1	LSB	B0
		0	0	0	0	0	0	0		0
2nd byte (2nd)	MSB	B7	B6	B5	B4	B3	B2	B1	LSB	B0
		0	0	0	0	0	0	0		0

形名

16-BT-131INK

2.3 CGRAM data write command

The CGRAM (character generator RAM) has a 3-bit address to store character Patterns of 5x7 dot matrix. Character patterns stored in the CGRAM can be outputted by specifying the character code (address) of DCRAM. The CGRAM addresses are assigned from 00H to 07H. (The other addresses are all for CGROM.) The CGRAM can store 8 types of character pattern. The CGRAM can be written-in by specifying its address. The command format is shown below.

【Command Format】

	<table><tr><td colspan="7">MSB</td><td>LSB</td></tr><tr><td>B7</td><td>B6</td><td>B5</td><td>B4</td><td>B3</td><td>B2</td><td>B1</td><td>B0</td></tr><tr><td>0</td><td>1</td><td>0</td><td>*</td><td>*</td><td>Y2</td><td>Y1</td><td>Y0</td></tr></table>	MSB							LSB	B7	B6	B5	B4	B3	B2	B1	B0	0	1	0	*	*	Y2	Y1	Y0	The CGRAM data write command and the CGRAM address are specified. Y0(LSB) ~ Y2(MSB) : CGRAM address (3 bits: for 8 characters)

D0(LSB) ~ D34(MSB): character pattern data (35 bits: 35 outputs for a digit)

*: Don't Care

[Setting relationship of CGRAM Addresses]

HEX	Y2	Y1	Y0	Specified CGRAM
0	0	0	0	RAM00(00H)
1	0	0	1	RAM01(01H)
2	0	1	0	RAM02(02H)
3	0	1	1	RAM03(03H)
4	1	0	0	RAM04(04H)
5	1	0	1	RAM05(05H)
6	1	1	0	RAM06(06H)
7	1	1	1	RAM07(07H)

[Setting relationship CGRAM Outputs]

D0	D1	D2	D3	D4
D5	D6	D7	D8	D9
D10	D11	D12	D13	D14
D15	D16	D17	D18	D19
D20	D21	D22	D23	D24
D25	D26	D27	D28	D29
D30	D31	D32	D33	D34

- The setting relationship of CGRAM outputs may vary depending of the VFD product.
- Refer to the individual specification.

2.4 ADRAM data write command

The ADRAM (Additional Data RAM) has a 5-bit address to store data.

The signal data specified by the ADRAM is directly outputted.

To write the ADRAM data, specify the ADRAM address before writing-in data.

For the setting relationship between the ADRAM address to set and display timing, refer to the section 2.5 Setting of display timing. The command format is shown below.

【Command Format】

	B7	B6	B5	B4	B3	B2	B1	B0
1st byte (1st)	0	1	1	X4	X3	X2	X1	X0

To select the ADRAM data write and to specify the ADRAM address.
(Ex: To specify the ADRAM address 00H.)

	B7	B6	B5	B4	B3	B2	B1	B0
2nd byte (2nd)	*	*	*	*	*	*	*	E0

To specify the signal data.
(Ex: To write-in the data to the ADRAM address 00H.)

- To continuously specify the signal data, specify the character codes only as shown below. Since the ADRAM addresses are automatically incremented, it is not necessary to specify the 1st byte. Addresses are specified from 00H to 17H incrementing 1 by 1. Up to 24 addresses can be continuously transferred.

	B7	B6	B5	B4	B3	B2	B1	B0
3rd byte (3rd)	*	*	*	*	*	*	*	E0

To specify the signal data.
(The data is written into the ADRAM address 01H.)

	B7	B6	B5	B4	B3	B2	B1	B0
4th byte (4th)	*	*	*	*	*	*	*	E0

To specify the signal data.
(The data is written into the ADRAM address 02H.)

	B7	B6	B5	B4	B3	B2	B1	B0
(25th) 25th byte	*	*	*	*	*	*	*	E0

To specify the signal data.
(The data is written into the ADRAM address 17H.)

X0(LSB) ~ X4(MSB): ADRAM address (5-bit)

E0:S1 "0": output OFF "1": output ON

*: Don't Care

形名

2.5 Display timing set command

The display timing command sets the display timing including the universal timing using 8-bit data. When the power is supplied or the RESET signal is inputted, the value is set to the initial value (1G to 16G). Be sure to execute this command before turning on the display light. Then, set the fixed value for each VFD. For the set value, refer to the individual VFD specification. The command format is shown below.

【Command Format】

	B7	B6	B5	B4	B3	B2	B1	B0
1st byte (1st)	1	1	1	0	0	0	*	*

To select the display timing set.

	B7	B6	B5	B4	B3	B2	B1	B0
2nd byte (2nd)	0	*	*	*	1	1	1	1

To select the display timing set and the universal timing enable/disable.

2.6 Dimming data write command

Brightness can be controlled in 240 levels using 8-bit data by setting the dimming data write command. When the power is supplied or the RESET signal is inputted, the register value is set to 0. Be sure to execute this command before turning on the display light. Then set the desired value.

[Command Format]

1st byte (1st)

B7	B6	B5	B4	B3	B2	B1	B0
1	1	1	0	0	1	*	*

 To select the dimming data set.

2nd byte (2nd)

B7	B6	B5	B4	B3	B2	B1	B0
H7	H6	H5	H4	H3	H2	H1	H0

 To select the dimming data set.

H0(LSB) ~ H7(MSB) : dimming data (8 bits: for 240 levels)

* : Don't Care

[Relationship between the dimming data and the dimming status]

H7	H6	H5	H4	H3	H2	H1	H0	Dimming data	Remarks
0	0	0	0	0	0	0	0	0/255	Initial value (*)
0	0	0	0	0	0	0	1	1/255	
0	0	0	0	0	0	1	0	2/255	
:	:	:	:	:	:	:	:	:	
1	1	1	0	1	1	1	1	239/255	
1	1	1	1	0	0	0	0	240/255	
1	1	1	1	0	0	0	1		
:	:	:	:	:	:	:	:		
1	1	1	1	1	1	1	1		

* The status when the power is supplied or the RESET signal is inputted.

2.7 Gray-level data write command

The Gray-level data command is used to control display brightness in 240 levels with the 8-bit data for each anode driver output (D0 ~ D34/S1).

When the power is supplied or the RESET signal is inputted, the register value is set to 0.

Be sure to execute this command before turning on the display light. Then set the desired value.

[Command Format]

	B7	B6	B5	B4	B3	B2	B1	B0
1st byte (1st)	1	0	1	*	*	J2	J1	J0

To select the gray-level data write command and specify the address to write-in.

(Ex: The gray-level register address 00H is specified.)

	B7	B6	B5	B4	B3	B2	B1	B0
2nd byte (2nd)	I7	I6	I5	I4	I3	I2	I1	I0

To write-in the gray-level data.

(Ex: The data is written into the gray-level register address 00H.)

- To continuously specify the address, specify the gray-level data only as shown below. As addresses are automatically incremented, it is not necessary to specify the first byte. The specified addresses are specified from 0H to 7H incrementing 1 by 1. The time between bytes (t_{DOFF}) is 2us(min).

	B7	B6	B5	B4	B3	B2	B1	B0
3rd byte (3nd)	I7	I6	I5	I4	I3	I2	I1	I0

To write-in the gray-level data.

(The data is written into the address 01H of the gray-level register.)

	B7	B6	B5	B4	B3	B2	B1	B0
4th byte (4th)	I7	I6	I5	I4	I3	I2	I1	I0

To write-in the gray-level data.

(The data is written into the address 02H of the gray-level register.)

J0(LSB) ~ J2(MSB) : to specify the address of the gray-level register (3 bits)

I0(LSB) ~ I7(MSB) : gray-level data (8 bits: for 240 gray-level)

* : Don't Care

• Address of the gray-level register

Address			Specified register
J2	J1	J0	
0	0	0	Gray-level register for outputting D0 ~ D34
0	0	1	Gray-level register for outputting S1
0	1	0	Don't Care
0	1	1	Don't Care
1	0	0	Don't Care
1	0	1	Don't Care
1	1	0	Don't Care
1	1	1	Don't Care

• Relationship between the data and gray-level

I7	I6	I5	I4	I3	I2	I1	I0	Gray-level data	Remarks
0	0	0	0	0	0	0	0	0/255	Initial value(*)
0	0	0	0	0	0	0	1	1/255	
0	0	0	0	0	0	1	0	2/255	
:	:	:	:	:	:	:	:	:	
1	1	1	0	1	1	1	1	239/255	
1	1	1	1	0	0	0	0	240/255	
1	1	1	1	0	0	0	1		
:	:	:	:	:	:	:	:		
1	1	1	1	1	1	1	1		

* The status when the power is supplied or the RESET signal is inputted.

2.8 Gray-level ON/OFF set command

The Gray-level ON/OFF set command has a 5-bit address which is used to specify the gray-level ON/OFF of the anode driver output (D0 ~ D34/S1) for each timing. When the gray-level ON is specified, the data is outputted in the corresponding pulse width to the value set by the gray-level data write command. When the power is supplied or the RESET signal is inputted, the register value is set to 0. Be sure to execute this command before turning on the display light. Then, set the desired value. For the setting relationship between the address and the display timing, refer to the section 2.5, Display timing set command. The command format is shown below.

【Command Format】

1st byte (1st)

MSB								LSB	
B7	B6	B5	B4	B3	B2	B1	B0		
1	1	0	X4	X3	X2	X1	X0		

 To select the gray-level ON/OFF set and specify address.
(Ex: The address 0H is specified.)

2nd byte (2nd)

MSB								LSB	
B7	B6	B5	B4	B3	B2	B1	B0		
*	*	*	*	*	K2	*	K0		

 To set the gray-level ON/OFF for each output.
(The data is written into the address 00H.)

- To continuously specify the gray-level ON/OFF set, specify the setting data only as shown below. As addresses are automatically incremented, it is not necessary to specify the first byte. Addresses are specified from 00H to 17H incrementing 1 by 1. The time between bytes (t_{DOFF}) is 2us(min).

3rd byte (3rd)

MSB								LSB	
B7	B6	B5	B4	B3	B2	B1	B0		
*	*	*	*	*	K2	*	K0		

 To set the gray-level ON/OFF for each output.
(Written into the address 01H.)

4th byte (4th)

MSB								LSB	
B7	B6	B5	B4	B3	B2	B1	B0		
*	*	*	*	*	K2	*	K0		

 To set the gray-level ON/OFF for each output.
(Written into the address 02H.)

.....
25th byte (25th)

MSB								LSB	
B7	B6	B5	B4	B3	B2	B1	B0		
*	*	*	*	*	K2	*	K0		

 To set the gray-level ON/OFF for each output.
(Written into the address 17H.)

X0(LSB) ~ X4(MSB) : address (5 bits)

K0(LSB), K2(MSB) : gray-level ON/OFF (6 bits) 0: gray-level OFF 1: gray-level ON

* : Don't Care

- Corresponding driver output to the gray-level ON/OFF setting

Data	Driver output
K0	Gray-level ON/OFF setting for the output of D0 ~ D34 0: gray-level OFF, 1: gray-level ON
*	-
K2	Gray-level ON/OFF setting for the output of S1 0: gray-level OFF, 1: gray-level ON

形名

16-BT-131INK

2.9 Display light ON/OFF set command

The display light ON/OFF set command are used to turn on all the display lights or turn them off. The all display lights OFF mode is mainly used for blinking or protecting the display from any misoperation to be caused when the power is supplied. The command format is shown below.

[Command Format]

	B7	B6	B5	B4	B3	B2	B1	B0
1st byte	1	1	1	0	1	0	LS	HS

To select the all display light ON/OFF and specify operation.

LS,HS: display operation data

* : Don't Care

● Set value and display status

LS	HS	Display status	Remarks
0	0	Normal operation	
1	0	All display lights OFF	* The status when the power is supplied or the RESET signal is inputted.

2.10 Stand-by mode command

The setting of the Stand-by mode command saves the power while the display is in the standing-by mode. The command format is shown below.

[Command format]

	B7	B6	B5	B4	B3	B2	B1	B0
1st byte	1	1	1	0	1	1	*	ST

To select the stand-by mode and specify operation.

ST: Stand-by setting bit 0: normal operation mode, 1: stand-by mode

*: Don't Care

2.11 CGROM codes

Table 2 shows the standard CGROM (the general-purpose code). For the custom-designed code, please consult with the engineer in charge. (Please keep the address 20H off.)

Table 2 CGROM Codes (General-purpose code:02)

2.12 Initial value at the time reset

The initial value when the RESET signal is input is shown in Table 3.

Table 3 The initial value when the RESET signal is input

No.	Set to	Initial value
1	DCRAM	DCRAM Address=00H ALL DCRAM Data=20H
2	CGRAM	CGRAM Address=00H ALL CGRAM Data=00H
3	ADRAM	ADRAM Address=00H ALL ADRAM Data=00H Segment OFF (S1 OFF)
4	Number of Digit Set	"00001111"
5	Dimming Set	0/255
6	Gray Level Set	J2 ~ J0="000" 0/255
7	Gray Level On/Off Set	GLRAM Address =00H K0,K2="0" (Gray Level Disable)
8	Display Light Set	L S="1" H S="0"(Display all off)
9	Stan-by Mode	ST="0"(Normal Mode)

[Remark]

Grey level data should be always set except "0" when if grey function is not used.

● Flowchart of Commands

1 Basic flowchart of commands

The flowchart below shows the basic flow of commands from the time when power is turned on to the time when the display lights up. After the power is turned on, the values in 2 and 3 are set to the fixed value for each VFD used. Refer to the individual specification for the fixed value.

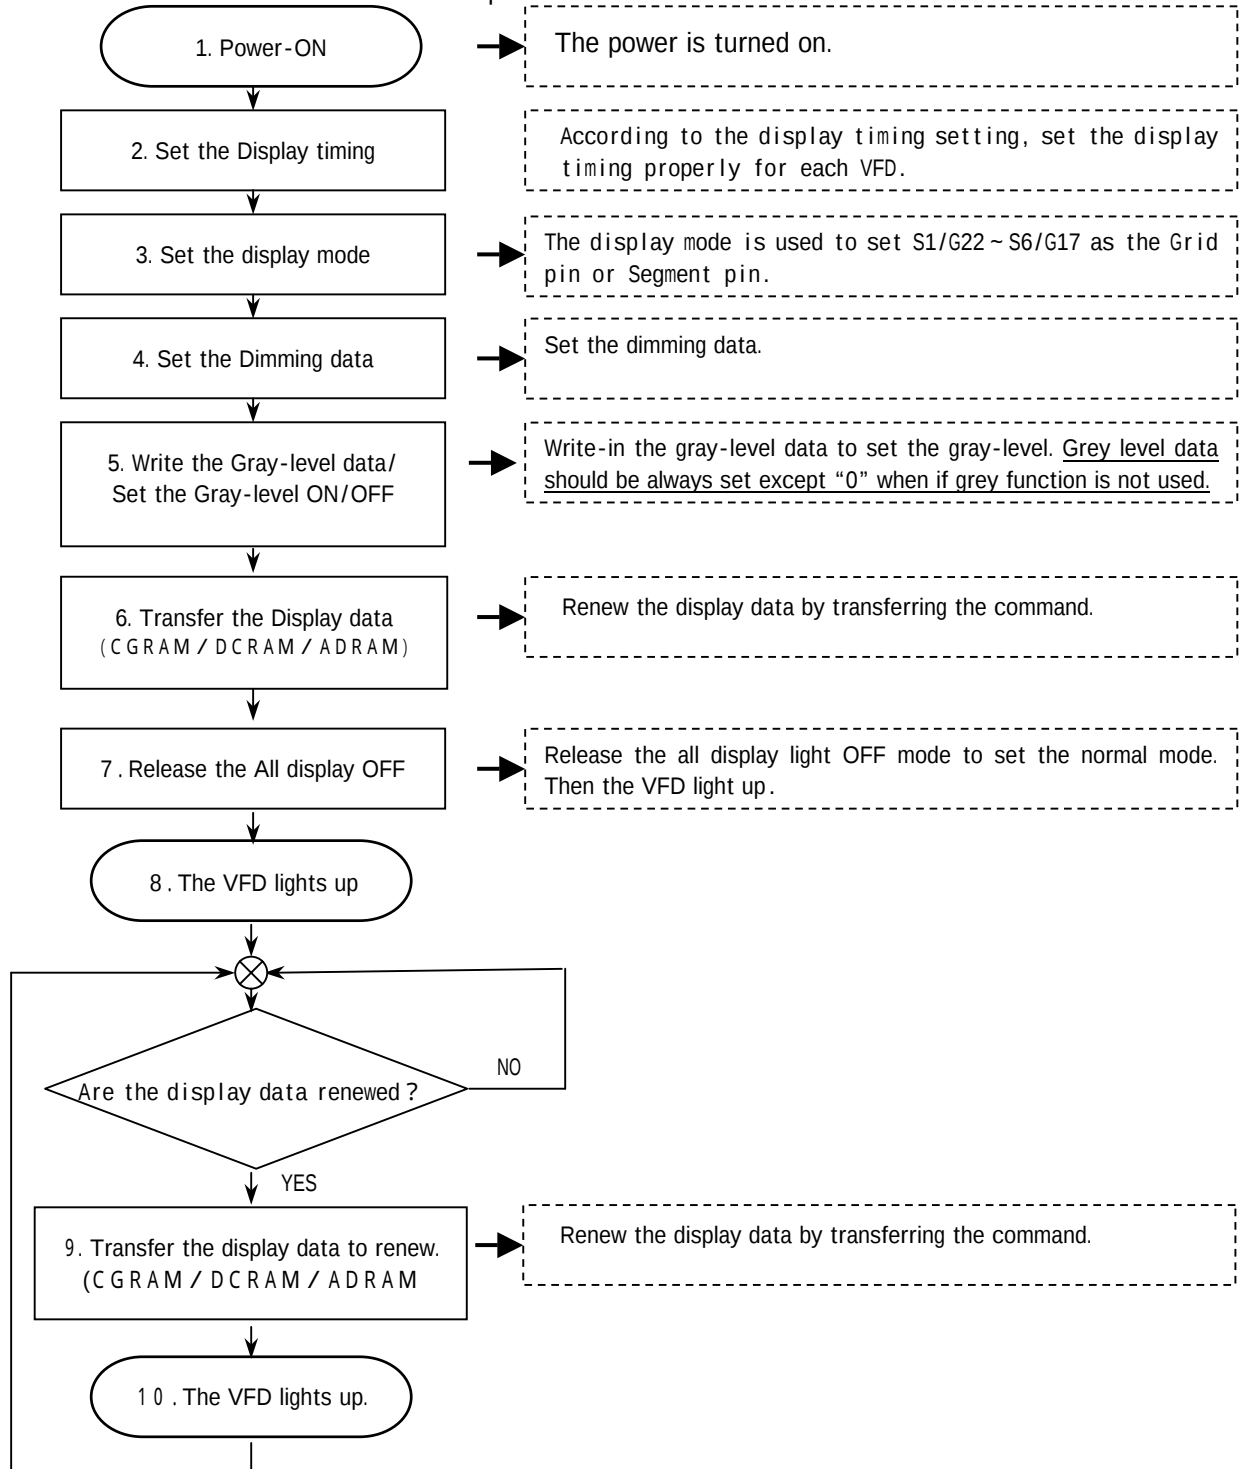

Fig. 4-1-1 Basic Command Flowchart

● Power-ON reset control

1 Power-ON reset circuit

For the power-on resetting, connect the resistor R_{rst} between the terminal to the logic power supply and the terminal to the system reset signal input, and the capacitor C_{rst} between the RST terminal and the GND terminal. An example of the circuit connection is shown below.

Fig.1 Power-ON reset circuit

2 Timing chart of resetting

Input the reset signal according to the figure shown below. Be sure not to transfer commands immediately after the reset signal is inputted. Because the command transferred before the definition of the internal status of the circuit may cause malfunction. Besides that, the value of t_{RST} varies depending on the externally built parts. It is recommended to transfer the command after allowing sufficient time for the IC to be defined. For the initial value after resetting, refer to the section 2.13

Fig. 2 Timing chart for resetting

Table 4 Time for Power-ON reset

Item	Symbol	Min	Typ	Max	Unit
Reset pulse width	t_{RST}	15	-	-	μs
Reset after Ready Time	t_{Raedy}	2	-	-	ms

# Vacuum Fluorescent Display Quality Inspection Standard

## 蛍光表示管品質判定基準

### General 一般

This standard should be adapted to the VFD quality inspection.

本仕様書は蛍光表示管の品質検査規格に適用される。

### Inspection Condition 検査条件

| Item                                  | Condition                                                                                                                                                                                                                              |
