

**Dual/Quad SPST, CMOS Analog Switches**

HI-200/HI-201 (dual/quad) are monolithic devices comprising independently selectable SPST switches which feature fast switching speeds (HI-200 240ns, and HI-201 185ns) combined with low power dissipation (15mW at 25°C). Each switch provides low "ON" resistance operation for input signal voltage up to the supply rails and for signal current up to 80mA. Rugged DI construction eliminates latch-up and substrate SCR failure modes.

All devices provide break-before-make switching and are TTL and CMOS compatible for maximum application versatility. HI-200/HI-201 are ideal components for use in high frequency analog switching. Typical applications include signal path switching, sample and hold circuit, digital filters, and operational amplifier gain switching networks.

**Features**

- Analog Voltage Range ..... ±15V
- Analog Current Range ..... 80mA
- Turn-On Time ..... 240ns
- Low  $r_{ON}$  ..... 55Ω
- Low Power Dissipation ..... 15mW
- TTL/CMOS Compatible

**Applications**

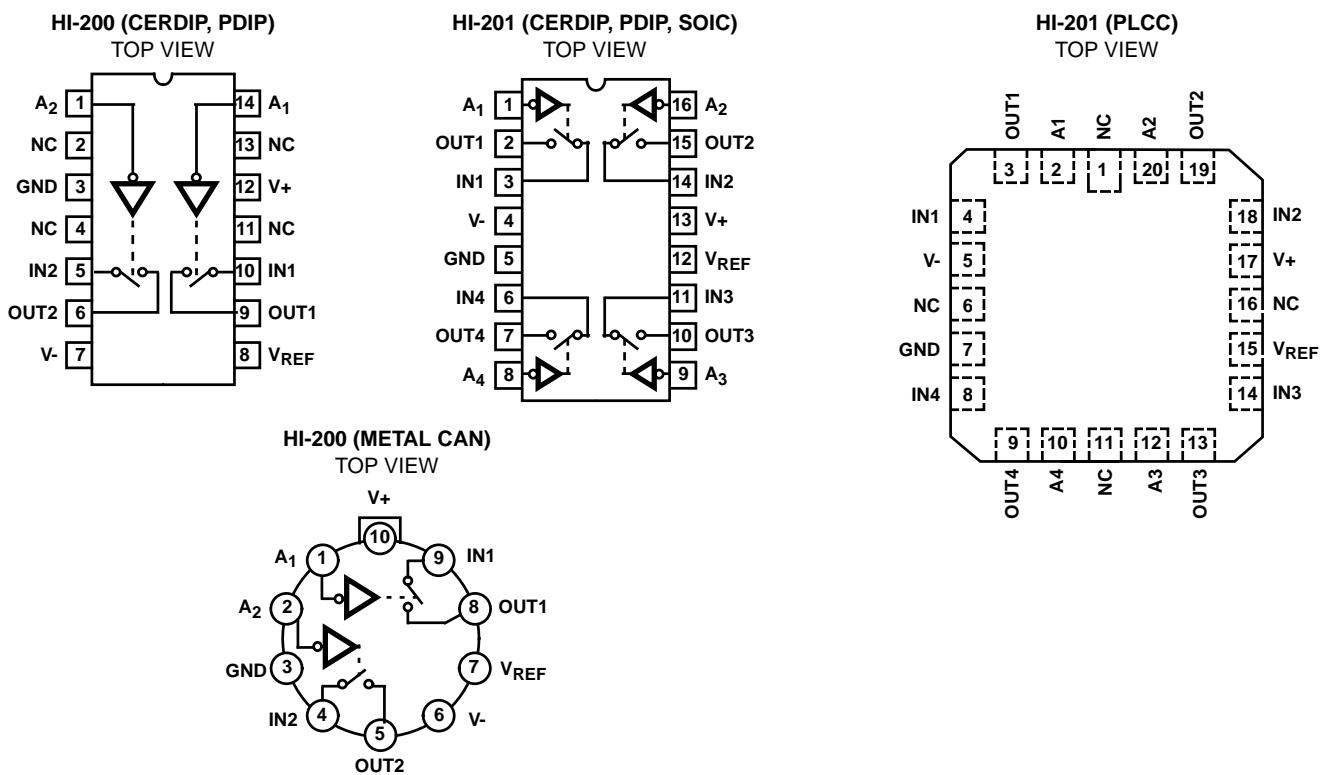

- High Frequency Analog Switching
- Sample and Hold Circuits
- Digital Filters
- Operational Amplifier Gain Switching Networks

## ***Application Information***

### ***Single Supply Operation***

The switch operation of the HI-200/201 is dependent upon an internally generated switching threshold voltage optimized for  $\pm 15V$  power supplies. The HI-200/201 does not provide the necessary internal switching threshold in a single supply system. Therefore, if single supply operation is required, the HI-300 series of switches is recommended. The HI-300 series will remain operational to a minimum +5V single supply.

Switch performance will degrade as power supply voltage is reduced from optimum levels ( $\pm 15V$ ). So it is recommended that a single supply design be thoroughly evaluated to ensure that the switch will meet the requirements of the application.

For further information see Application Notes AN520, AN521, AN531, AN532, AN543 and AN557.
