■ EXTERNAL CURRENT BOOST CONNECTIONS FOR IC PEAK GREATER THAN 1.5A

1a. External NPN Switch

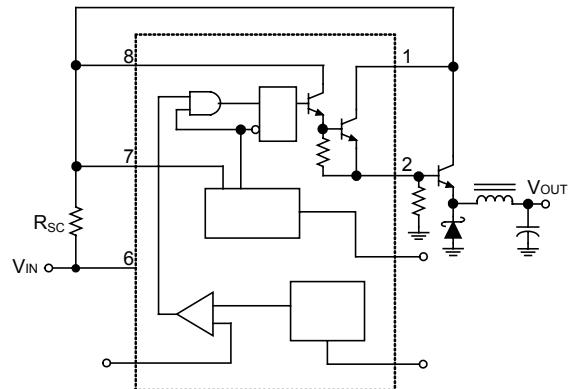

1b. External NPN Saturated Switch
(See Note 4)

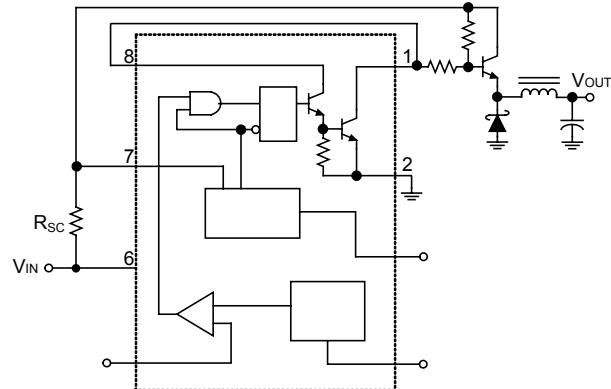

NOTE: 4. If the output switch is driven into hard saturation (non-Darlington configuration) at low switch currents (= 300mA) and high driver currents (= 30mA), it may take up to 2.0 μ s to come out of saturation. This condition will shorten the off time at frequencies = 30kHz, and is magnified at high temperatures. This condition does not occur with a Darlington configuration, since the output switch cannot saturate. If a non-Darlington configuration is used, the following output drive condition is recommended.

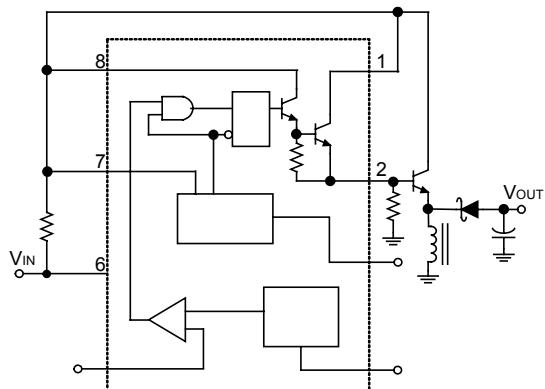

2a. External NPN Switch

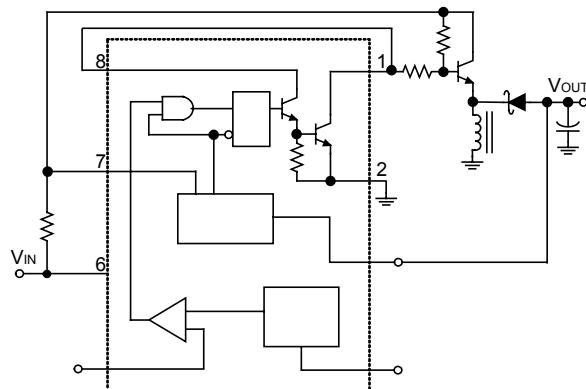

2b. External PNP Saturated Switch

$V_{CE(SAT)}$ - Saturation voltage of the output switch.

V_F - Forward voltage drop of the ringback rectifier.

The following power supply characteristics must be chosen:

V_{IN} - Nominal input voltage.

V_{OUT} - Desired output voltage,
 $|V_{OUT}| = 1.25 (1+RB/RA)$

I_{OUT} - Desired output current.

F_{MIN} - Minimum desired output switching frequency at the selected values for V_{IN} and I_{OUT} .

$V_{RIPPLE(P-P)}$ - Desired peak-to-peak output ripple voltage. In practice, the calculated value will need to be increased due to the capacitor equivalent series resistance and board layout. The ripple voltage should be kept to a low value since it will directly effect the line and load regulation.
