

Jameco Part Number 41970      256K-BIT CMOS STATIC RAM  
 32K-WORD BY 8-BIT

**Description**

The  $\mu$ PD43256B is a high speed, low power, and 262, 144 bits (32,768 words by 8 bits) CMOS static RAM. Battery backup is available (L, LL, A, and B versions). And A and B versions are wide voltage operations. The  $\mu$ PD43256B is packed in 28-pin plastic DIP, 28-pin plastic SOP and 28-pin plastic TSOP (I).

**Features**

- 32,768 words by 8 bits organization
- Fast access time: 70, 85, 100, 120, 150 ns (MAX.)
- Wide voltage range (A version:  $V_{cc} = 3.0$  to  $5.5$  V, B version:  $V_{cc} = 2.7$  to  $5.5$  V)
- 2 V data retention
- OE input for easy application

Part number	Access time ns (MAX.)	Operating supply voltage V	Operating temperature °C	Standby supply current $\mu$ A (MAX.)	Data retention supply current <sup>Note 1</sup> $\mu$ A (MAX.)
$\mu$ PD43256B-L	70, 85	4.5 to 5.5	0 to 70	50	3
$\mu$ PD43256B-LL	70, 85			15	2
★ $\mu$ PD43256B-A	85, 100 <sup>Note 2</sup> , 120 <sup>Note 2</sup>	3.0 to 5.5			
★ $\mu$ PD43256B-B <sup>Note 2</sup>	100, 120, 150	2.7 to 5.5			

- Notes** 1.  $T_A \leq 40$  °C,  $V_{cc} = 3$  V  
 2. Access time : 85 ns (MAX.) ( $V_{cc} = 4.5$  to  $5.5$  V)

**Version X and P**

This data sheet can be applied to the version X and P. Each version is identified with its lot number. Letter X in the fifth character position in a lot number signifies version X, letter P, version P.

The information in this document is subject to change without notice.

**Absolute Maximum Ratings**

Parameter	Symbol	Rating	Unit
Supply voltage	V <sub>CC</sub>	-0.5 <sup>Note</sup> to +7.0	V
Input/Output voltage	V <sub>I</sub>	-0.5 <sup>Note</sup> to V <sub>CC</sub> + 0.5	V
Operating ambient temperature	T <sub>A</sub>	0 to 70	°C
Storage temperature	T <sub>stg</sub>	-55 to +125	°C

**Note** -3.0 V (MIN.) (Pulse width 50 ns)

**Caution** Exposing the device to stress above those listed in absolute maximum ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational sections of this characteristics. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Note** Loading condition is 1TTL + 100 pF.

**Remark** These AC characteristics are in common regardless of package types and L, LL versions.

Write Cycle Timing Chart 1 ( $\overline{WE}$  Controlled)

- Cautions**
1.  $\overline{CS}$  or  $\overline{WE}$  should be fixed to high level during address transition.
  2. When I/O pins are in the output state, do not apply to the I/O pins signals that are opposite in phase with output signals.

- Remarks**
1. Write operation is done during the overlap time of a low level  $\overline{CS}$  and a low level  $\overline{WE}$ .
  2. When  $\overline{WE}$  is at low level, the I/O pins are always high impedance. When  $\overline{WE}$  is at high level, read operation is executed. Therefore  $\overline{OE}$  should be at high level to make the I/O pins high impedance.
  3. If  $\overline{CS}$  changes to low level at the same time or after the change of  $\overline{WE}$  to low level, the I/O pins will remain high impedance state.

**Write Cycle Timing Chart 2 ( $\overline{CS}$  Controlled)**

- Cautions**
1.  $\overline{CS}$  or  $\overline{WE}$  should be fixed to high level during address transition.
  2. When I/O pins are in the output state, do not apply to the I/O pins signals that are opposite in phase with output signals.

**Remark** Write operation is done during the overlap time of a low level  $\overline{CS}$  and a low level  $\overline{WE}$ .

**Low Vcc Data Retention Characteristics**

**L Version (μPD43256B-L: T<sub>A</sub> = 0 to 70 °C)**

Parameter	Symbol	Test conditions	MIN.	TYP.	MAX.	Unit
Data retention supply voltage	V <sub>CCDR</sub>	$\overline{CS} \geq V_{CC} - 0.2 \text{ V}$	2.0		5.5	V
Data retention supply current	I <sub>CCDR</sub>	V <sub>CC</sub> = 3.0 V, $\overline{CS} \geq V_{CC} - 0.2 \text{ V}$		0.5	20 <sup>Note</sup>	μA
Chip deselection to data retention mode	t <sub>CDR</sub>		0			ns
Operation recovery time	t <sub>R</sub>		5			ms

**Note** 3 μA (T<sub>A</sub> ≤ 40 °C)

**LL Version (μPD43256B-LL: T<sub>A</sub> = 0 to 70 °C)**

**A Version (μPD43256B-A: T<sub>A</sub> = 0 to 70 °C)**

**B Version (μPD43256B-B: T<sub>A</sub> = 0 to 70 °C)**

Parameter	Symbol	Test conditions	MIN.	TYP.	MAX.	Unit

P28GW-55-9KL-1

**Recommended Soldering Conditions**

The following conditions (See table below) must be met when soldering μPD43256B. For more details, refer to our document “**SEMICONDUCTOR DEVICE MOUNTING TECHNOLOGY MANUAL**” (C10535E).

Please consult with our sales offices in case other soldering process is used, or in case soldering is done under different conditions.

**Types of Surface Mount Device**

μPD43256BGU: 28-pin plastic SOP (450 mil)

μPD43256BGW-9JL: 28-pin plastic TSOP (I) (8 × 13.4 mm) (Normal bent)

μPD43256BGW-9KL: 28-pin plastic TSOP (I) (8 × 13.4 mm) (Reverse bent)

Please consult with our sales offices.

**Type of Through Hole Mount Device**

μPD43256BCZ: 28-pin plastic DIP (600 mil)

Soldering process	Soldering conditions
Wave soldering (only to leads)	Solder temperature: 260 °C or below, Flow time: 10 seconds or below
Partial heating method	Terminal temperature: 300 °C or below, Time: 3 seconds or below (Per one lead)

**Caution Do not jet molten solder on the surface of package.**

[MEMO]

## NOTES FOR CMOS DEVICES

### ① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

**Note:** Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

### ② HANDLING OF UNUSED INPUT PINS FOR CMOS

**Note:** No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS device behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to  $V_{DD}$  or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

### ③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

**Note:** Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

## [MEMO]

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.

NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.

While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.

NEC devices are classified into the following three quality grades:

"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

Specific: Aircrafts, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.

Anti-radioactive design is not implemented in this product.
