## SDR-Kits - Amphenol Connex CAL Standards for the DG8SAQ VNWA Revision 5 May 28-2017 - Page1 by Kurt Poulsen OZ7OU

On this sheet you will find the settings required in 'Calibration Settings" and "Simple SOLT" for the Reflection (S11/S22) and Transmission (S21/S12) calibrations. Find on page 2 arbitrary calibration settings. - Please note that if you want to calibrate to the Reference plane of the VNWA Female TX SMA connector on the cabinet, then use the settings for the "SMA Male Reference Plane".

- When using testcables and measuring both S11 and S21, then the Thru adaptor is used, during S21 calibration, but removed during real measurements. To compensate for the changed transmission delay between the TX and RX port, you have to enter the delay for the Thru adaptor in the calibration settings. When doing so the reference planes for both reflection and transmission remain "in sync" at the chosen testcable's calibration plane.

- When the test cables have male SMA at the testing end, the Female Calibration Kit data is used, and likewise for female SMA the Male Calibration Kit data is used.

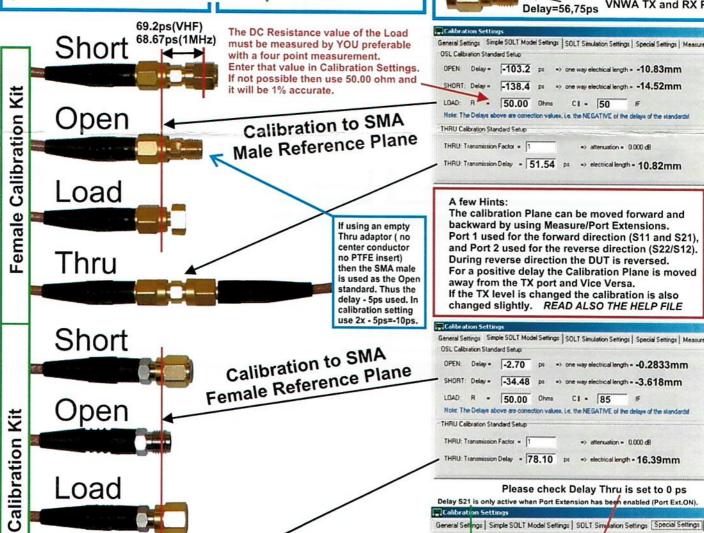

Do not use the Crosstalk Calibration for general use.

OSL Calibration Standard Setup

For protection of the VNWA TX and RX Ports

Male

Thru

Revision 5 Updated: 28/05/2017

## on values, i.e. the NEGATIVE of I THRU Calibration Standard Setup

50.00 Ohms

THRU: Transmission Factor = 1 THRU: Transmission Delay - 51.54 ps -> electrical length - 10.82mm

OPEN: Delay = -103.2 ps -> one way electrical length - -10.83mm

SHORT: Delay = -138.4 ps -> one way electrical length - -14.52mm

CI - 50

## A few Hints:

The calibration Plane can be moved forward and backward by using Measure/Port Extensions. Port 1 used for the forward direction (S11 and S21), and Port 2 used for the reverse direction (\$22/\$12). During reverse direction the DUT is reversed. For a positive delay the Calibration Plane is moved away from the TX port and Vice Versa. If the TX level is changed the calibration is also changed slightly. READ ALSO THE HELP FILE

## General Settings | Simple SOLT Model Settings | SOLT Simulation Settings | Special Settings | Measure

OSL Calibration Standard Setup Delay = -2.70 ps => one way electrical length = -0.2833mm SHORT: Delay = -34.48 ps => one way electrical length = -3.618mm - 50.00 Ohms CI - 85 n values, i.e. the NEGATIVE of the delege of the standards! Note: The Delays above are con-THRU Calibration Standard Setup THRU: Transmission Factor = 1 THRU: Transmission Delay = 78.10 ps => electrical length = 16.39mm

Please check Delay Thru is set to 0 ps

Delay 521	is only active when Port Extension has been enabled (Port Ext.ON).
Calibrati	on Settings
General Set	ngs   Simple SOLT Model Settings   SOLT Simulation Settings   Special Settings
Velocity fac	or for calculation of calibration standard length
Velocity Fac	or = 07
Compatibility	setting to previous software versions. If yoused set to zero!
Note: This	elting shifts transmission and reflect chibration planes against each other.
It acts as a	port extension and will only be active if port extensions are enabled.
Delay Thru	formerly in Port Extensions) 0 ps
