## TYPICAL OHMS SHORT CIRCUIT CURRENT

|         |             |             |            |           |            |            |
|---------|-------------|-------------|------------|-----------|------------|------------|
| Range   | 400         | 4k          | 40k        | 400k      | 4M         | 40M        |
| Current | 700 $\mu$ A | 170 $\mu$ A | 20 $\mu$ A | 2 $\mu$ A | .2 $\mu$ A | .2 $\mu$ A |

1 Accuracy is given as  $\pm(\% \text{ of reading}) + [\text{number of least significant digits}]$  at 18°C to 28°C, with relative humidity up to 90%, for a period of one year after calibration. In the 4½-digit mode, multiply the number of least significant digits (counts) by 10. AC conversions are ac-coupled, true rms responding, calibrated to the rms value of a sine wave input, and valid from 5% to 100% of range. AC crest factor can be up to 3 at full scale, 6 at half scale. For non-sinusoidal wave forms add -(2% Rdg x 2% Fs) typical, for a crest factor up to 3.

2 Below 10% of range, add 6 digits.

3 With film capacitor or better using Relative mode to zero residual.

4 10A continuous, 20A for 30 seconds maximum.
