# HD66740

(112 × 80-dot Graphics LCD Controller/Driver)

# HITACHI

ADE-207-334(Z)

Rev 1.0

April, 2001

---

## Description

The HD66740, 112-by-80 dot-matrix graphics LCD controller and driver LSI, displays graphics such as text, kanji and pictograms. It can be configured to drive a dot-matrix liquid crystal under the control of the microprocessor connected via the clock-synchronized serial or 4/8-bit bus. The HD66740 has a smooth vertical scroll display and a double-height display for the remaining bit map areas. It fixed-displays a part of the graphics icons so that the user can easily see a variety of information.

The HD66740 has various functions to reduce the power consumption of an LCD system such as low-voltage operation of 1.8 V min., a booster to generate maximum five-times LCD drive voltage from the supplied voltage, and voltage-followers to decrease the direct current flow in the LCD drive bleeder-resistors. Combining these hardware functions with software functions such as standby and sleep modes allows fine power control. The HD66740 is suitable for any portable battery-driven product requiring long-term driving capabilities such as cellular phones, pagers, or electronic wallets.

## Features

- Control and drive of a graphics LCD
- 112 × 80-dot display
- Fixed display of graphics icons (pictograms)
- Low-power operation support:
  - $V_{CC} = 1.8$  to 3.6 V (low voltage)
  - $V_{LCD} = 4.5$  to 15.0 V (liquid crystal drive voltage)
  - Triple, quadruple, or five-times booster for liquid crystal drive voltage
  - 64-step contrast adjuster and voltage followers to decrease direct current flow in the LCD drive bleeder-resistors
  - Power-save functions such as the standby mode and sleep mode supported
  - Programmable drive duty ratios and bias values displayed on LCD
- High-speed clock-synchronized serial interface (serial transfer rate: 5 MHz max.)
- I2C bus interface

Preliminary: The specifications of this device are subject to change without notice. Please contact your nearest Hitachi's Sales Dept. regarding specifications.

- High-speed 4-/8-bit bus interface capability
- 112-segment × 80-common liquid crystal display driver
- 1,120-byte (112 × 80 dots) character generator RAM
- Vertical smooth scroll
- Partial smooth scroll control (fixed display of graphics icons)
- Vertical double-height display by each display line
- Black-and-white reversed display
- Wide range of instruction functions:
  - Display on/off control, black-and-white reversed
- No wait time for instruction execution and RAM access
- Internal oscillation and hardware reset
- n-raster-row AC liquid-crystal drive (C-pattern waveform drive)
- Shift change of segment and common driver
- Tape carrier package (TCP)

**Table 1 Programmable Display Sizes and Duty Ratios**

<b>Duty Ratio</b>	<b>Optimum Drive Bias</b>	<b>Graphics Display</b>			
		<b>Bit Map</b>	<b>12 x 13-dot Font Width</b>	<b>14 x 15-dot Font Width</b>	<b>16 x 16-dot Font Width</b>
1/32	1/7	112 × 32 dots	2 lines × 9 characters	2 lines × 8 characters	2 lines × 7 characters
1/40	1/7	112 × 40 dots	3 lines × 9 characters	2.5 lines × 8 characters	2.5 lines × 7 characters
1/48	1/8	112 × 48 dots	3 lines × 9 characters	3 lines × 8 characters	3 line × 7 characters
1/56	1/8	112 × 56 dots	4 lines × 9 characters	3.5 lines × 8 characters	3.5 lines × 7 characters
1/64	1/9	112 × 64 dots	5 lines × 9 characters	4 lines × 8 characters	4 lines × 7 characters
1/72	1/9.5	112 × 72 dots	5 lines × 9 characters	4.5 lines × 8 characters	4.5 lines × 7 characters
1/80	1/10	112 × 80 dots	6 lines × 9 characters	5 lines × 8 characters	5 lines × 7 characters

<Target values>

**Total Current Consumption Characteristics (Vcc = 3 V, TYP Conditions, LCD Drive Power Current Included)**

Character Display Dot Size	Duty Ratio	R-C Oscillation Frequency	Frame Frequency	Total Power Consumption				
				Normal Display Operation			Sleep Mode	Standby Mode
Internal Logic	LCD Power	Total*						
112 x 32 dots	1/32	75 kHz	73 Hz	(27 μA)	(16 μA)	Triple (75 μA)	(15 μA)	0.1 μA
112 x 40 dots	1/40	75 kHz	73 Hz	(27 μA)	(16 μA)	Triple (75 μA)	(15 μA)	
112 x 48 dots	1/48	75 kHz	74 Hz	(27 μA)	(16 μA)	Triple (75 μA)	(15 μA)	
112 x 56 dots	1/56	75 kHz	74 Hz	(27 μA)	(16 μA)	Triple (75 μA)	(15 μA)	
112 x 64 dots	1/64	75 kHz	73 Hz	(27 μA)	(18 μA)	Quadruple (99 μA)	(15 μA)	
112 x 72 dots	1/72	80 kHz	70 Hz	(32 μA)	(18 μA)	Quadruple (104 μA)	(15 μA)	
112 x 80 dots	1/80	90 kHz	70 Hz	(35 μA)	(20 μA)	Five-times (135 μA)	(15 μA)	

Note : When a triple, quadruple, or five-times booster is used:  
 the total power consumption = Internal logic current + LCD power current x 3 (triple booster),  
 the total power consumption = Internal logic current + LCD power current x 4 (quadruple booster), and  
 the total power consumption = Internal logic current + LCD power current x 5 (five-times booster)

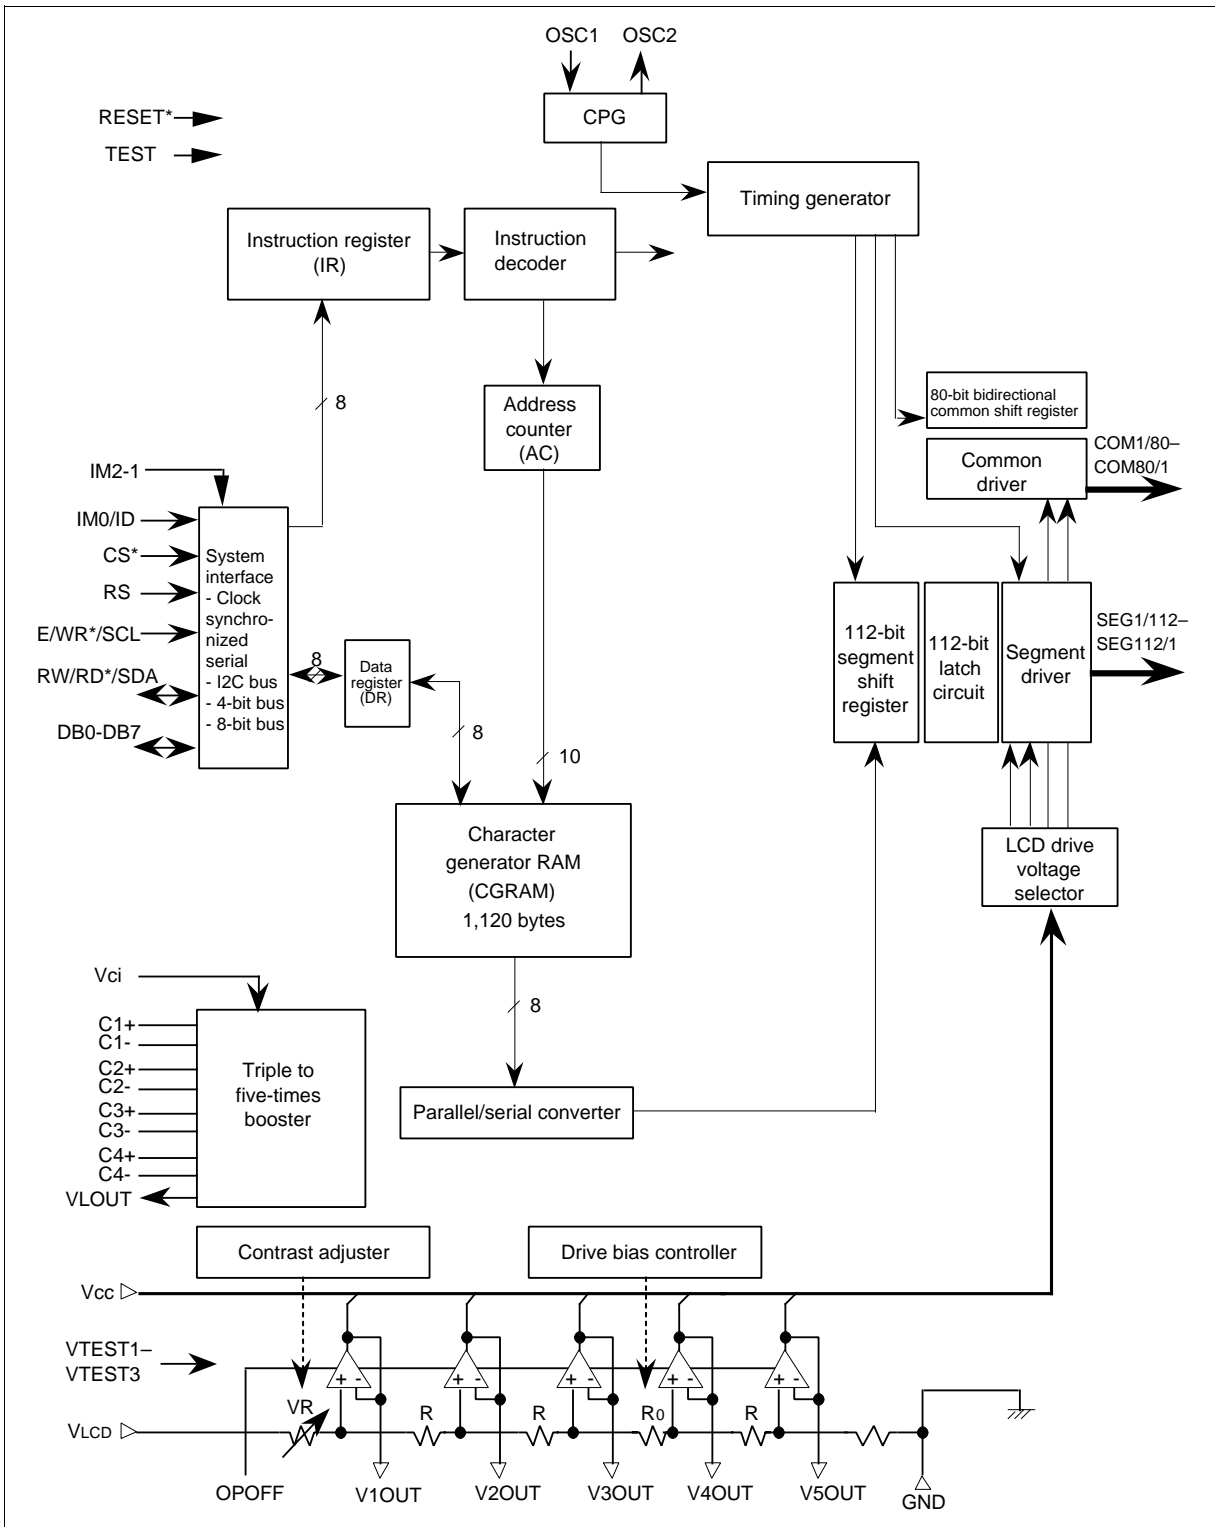

**Type Name**

Types	External Dimensions	Bus Interface	Operation Voltages
HD66740TB0	Bending TCP	4/8-bits parallel and clock synchronized serial	1.8 V to 3.6 V
HD66740WTB0	Bending TCP	4/8-bits parallel and I2C bus interface	
HCD66740BP	Au-bumped chip	4/8-bits parallel and clock synchronized serial	
HCD66740WBP	Au-bumped chip	4/8-bits parallel and I2C bus interface	

## LCD Family Comparison

Items	HD66725	HD66728	HD66740 (Under development)
Character display sizes	16 characters x 3 lines	16 characters x 10 lines	—
Graphic display sizes	96 x 26 dots	112 x 80 dots	112 x 80 dots
Multiplexing icons	192	—	—
Annunciator	1/2 duty: 192	—	—
Key scan control	8 x 4	8 x 4	—
LED control ports	—	—	—
General output ports	3	3	—
Operating power voltages	1.8 V to 5.5 V	1.8 V to 5.5 V	1.8 V to 3.6 V
Liquid crystal drive voltages	3 V to 6 V	4.5 V to 15 V	4.5 V to 15 V
I2C bus	—	—	I2C bus interface (HD66740W)
Serial bus	Clock-synchronized serial	Clock-synchronized serial	Clock-synchronized serial
Parallel bus	4 bits, 8 bits	4 bits, 8 bits	4 bits, 8 bits
Expansion driver control	Impossible	Impossible	Impossible
Liquid crystal drive duty ratios	1/2, 10, 18, 26	1/8, 16, 24, 32, 40, 48, 56, 64, 72, 80	1/8, 16, 24, 32, 40, 48, 56, 64, 72, 80
Liquid crystal drive biases	1/4 to 1/6.5	1/4 to 1/10	1/4 to 1/10
Liquid crystal drive waveforms	B	B, C	B, C
Liquid crystal voltage booster	Single, double, or triple	Triple, quadruple, or five-times	Triple, quadruple, or five-times
Bleeder-resistor for liquid crystal drive	Incorporated (external)	Incorporated (external)	Incorporated (external)
Liquid crystal drive operational amplifier	Incorporated	Incorporated	Incorporated
Liquid crystal contrast adjuster	Incorporated	Incorporated	Incorporated
Horizontal smooth scroll	3-dot unit	—	—
Vertical smooth scroll	Line unit	Line unit	Line unit
Double-height display	Yes	Yes	Yes
DDRAM	80 x 8	160 x 8	—
CGROM	20,736	20,736	—
CGRAM	384 x 8	1,120 x 8	1,120 x 8
SEGRAM	96 x 8	—	—
No. of CGROM fonts	240 + 192	240 + 192	—
No. of CGRAM fonts	64	64	—
Font sizes	6 x 8	6 x 8	—
Bit map area	96 x 26	112 x 80	112 x 80
R-C oscillation resistor/ oscillation frequency	External resistor, incorporated (32 kHz)	External resistor (70–90 kHz)	External resistor (70–90 kHz)
Reset function	External	External	External
Low power control	Partial display off Oscillation off Liquid crystal power off Key wake-up interrupt	Partial display off Oscillation off Liquid crystal power off Key wake-up interrupt	Partial display off Oscillation off Liquid crystal power off
SEG/COM direction switching	SEG, COM	SEG, COM	SEG, COM
QFP package	—	—	—
TQFP package	—	—	—
TCP package	TCP-170	TCP-243	TCP-233
Bare chip	—	—	—
Bumped chip	Yes	Yes	Yes
No. of pins	170	243	243
Chip sizes	10.97 x 2.51	13.67 x 2.78	9.40 x 2.18
Pad intervals	80 μm	70 μm	50 μm

"V <sub>CC</sub> "	"GND"	I <sup>2</sup> C bus interface																	
"V <sub>CC</sub> "	"V <sub>CC</sub> "	80-system parallel bus interface																	
IM0/ID	1	I	GND or V <sub>CC</sub>	<p>Selects the transfer bus length for a parallel bus interface.                      GND: 8-bit bus, V<sub>CC</sub>: 4-bit bus                      Inputs the ID of the device ID code for a serial bus and I<sup>2</sup>C bus interface.</p>															
CS*	1	I	MPU	<p>Selects the HD66740:                      Low: HD66740 is selected and can be accessed                      High: HD66740 is not selected and cannot be accessed                      Must be fixed at GND level when not in use.</p>															
RS	1	I	MPU	<p>Selects the register for a parallel bus interface.                      Low: Instruction High: RAM access                      Must be fixed at GND level when not in use.</p>															
E/WR*/SCL	1	I	MPU	<p>For an 80-system parallel bus interface, serves as a write strobe signal and writes data at the low level.                      For a 68-system parallel bus interface, serves as an enable signal to activate data read/write operation.                      Inputs the serial transfer clock for a serial interface.                      Fetches data at the rising edge of a clock.</p>															
RW/RD*/SDA	1	I or I/O	MPU	<p>For an 80-system parallel bus interface, serves as a write strobe signal and reads data at the low level.                      For a 68-system parallel bus interface, serves as a signal to select data read/write operation.                      Low: Write High: Read                      Serves as the bidirectional serial transfer data for a serial interface. Sends/Receives data.</p>															
DB0–DB7	8	I/O or I	MPU	<p>Serves as a bidirectional data bus for a parallel bus interface.                      For a 4-bit bus, data transfer uses DB7-DB4                      Must be fixed at GND level when serial interface mode is used.</p>															

**Table 2 Pin Functional Description (cont)**

Signals	Number of Pins	I/O	Connected to	Functions
COM1/80– COM80/1	80	O	LCD	<p>Common output signals for graphics display: COM1 to COM8 for the first line, COM9 to COM16 for the second line, COM17 to COM24 for the third line, COM25 to COM32 for the fourth line, and COM73 to COM80 for the 10th line. All the unused pins output unselected waveforms. In the sleep mode (SLP = 1) or standby mode (STB = 1), all pins output GND level.</p> <p>The CMS bit can change the shift direction of the common signal. For example, if CMS = 0, COM1/80 is COM1. If CMS = 1, COM1/80 is COM80</p> <p>Note that the start position of the common output (the first line) is shifted by CN1–CN0 bits.</p>
SEG1/112– SEG112/1	112	O	LCD	<p>Segment output signals for graphics display. In the sleep mode (SLP = 1) or standby mode (STB = 1), all pins output GND level.</p> <p>The SGS bit can change the shift direction of the segment signal. For example, if SGS = 0, SEG1/112 is SEG1. If SGS = 1, SEG1/112 is SEG112.</p>
V1OUT– V5OUT	5	I or O	Open or external bleeder-resistor	Used for output from the internal operational amplifiers when they are used (OPOFF = GND); attach a capacitor to stabilize the output. When the amplifiers are not used (OPOFF = V <sub>CC</sub> ), V1 to V5 voltages can be supplied to these pins externally.
V <sub>LCD</sub>	3	—	Power supply	Power supply for LCD drive. V <sub>LCD</sub> – GND = 15 V max.
V <sub>CC</sub> , GND	12	—	Power supply	V <sub>CC</sub> : +1.8 V to +3.6 V; GND (logic): 0 V
OSC1, OSC2	2	I or O	Oscillation-resistor or clock	For R-C oscillation using an external resistor, connect an external resistor. For external clock supply, input clock pulses to OSC1.
Vci	5	I	Power supply	<p>Inputs a reference voltage and supplies power to the booster; generates the liquid crystal display drive voltage from the operating voltage. The boosting output voltage must not be larger than the absolute maximum ratings.</p> <p>Must be left disconnected when the booster is not used.</p>
VLOUT	3	O	V <sub>LCD</sub> pin/booster capacitance	Potential difference between Vci and GND is triple- to five-times-boosted and then output. Magnitude of boost is selected by instruction.

Table 2 Pin Functional Description (cont)

Signals	Number of Pins	I/O	Connected to	Functions
C1+, C1-	8	—	Booster capacitance	External capacitance should be connected here for boosting.
C2+, C2-	6	—	Booster capacitance	External capacitance should be connected here when using the triple or more booster.
C3+, C3-	6	—	Booster capacitance	External capacitance should be connected here when using the quadruple and five-times booster.
C4+, C4-	6	—	Booster capacitance	External capacitance should be connected here when using the five-times booster.
RESET*	1	I	MPU or external R-C circuit	Reset pin. Initializes the LSI when low.
OPOFF	1	I	V <sub>CC</sub> or GND	Turns the internal operational amplifier off when OPOFF = V <sub>CC</sub> , and turns it on when OPOFF = GND. If the amplifier is turned off (OPOFF = V <sub>CC</sub> ), V1 to V5 must be supplied to the V1OUT to V5OUT pins.
VccDUM	1	O	Input pins	Outputs the internal V <sub>CC</sub> level; shorting this pin sets the adjacent input pin to the V <sub>CC</sub> level.
GNDDUM	1	O	Input pins	Outputs the internal GND level; shorting this pin sets the adjacent input pin to the GND level.
Dummy	5	—	—	Dummy pad. Must be left disconnected.
TEST	1	I	GND	Test pin. Must be fixed at GND level.
VTEST1	1	I	GND or V <sub>CC</sub>	Adjusts the driving capability of the internal operational amplifier for the LCD. This signal enters the normal drive mode in the GND side, and it enters the high-power drive mode in the VCC side. When the display quality is not sufficient, use the high-power drive mode even though the power-consumption current is large.
VTEST2	1	—	—	Test pin. Must be left disconnected.
VTEST3	1	I	V <sub>CC</sub> or GND	Adjusts the driving capability of the internal operational amplifier for the LCD. This signal enters the normal drive mode or high-power mode in the GND side according to the VTEST1 pin setting, and it enters the low-power drive mode in the V <sub>CC</sub> side. Use this signal in the low-power mode so that the display quality is not lowered.

## Block Function Description

### System Interface

The HD66740 has six types of system interfaces, and a clock-synchronized serial, an I2C bus interface, a 68-system 4-bit/8-bit bus, and a 80-system 4-bit/8-bit bus. The interface mode is selected by the IM2-0 pins.

The HD66740 has two 8-bit registers: an instruction register (IR) and a data register (DR).

The IR stores instruction codes, such as clear display, display control, and address information for the display character generator RAM (CGRAM).

The DR temporarily stores data to be written into the CGRAM. Data written into the DR from the MPU is automatically written into the CGRAM by internal operation. When address information is written into the IR, data is read and then stored in the DR from the CGRAM by internal operation. Data is read through the DR when reading from the RAM, and the first read data is invalid and the second and the following data are normal. After reading, data in the CGRAM at the next address is sent to the DR for the next reading from the MPU.

Execution time for instruction excluding clear display is 0 clock cycle and instructions can be written in succession.

**Table 3 Register Selection by RS and R/W Bits**

R/W Bits	RS Bits	Operations
0	0	Write instructions to IR
1	0	—
0	1	DR write as an internal operation (DR to CGRAM)
1	1	DR read as an internal operation (CGRAM to DR)

### Address Counter (AC)

The address counter (AC) assigns addresses to the CGRAM. When an address set instruction is written into the IR, the address information is sent from the IR to the AC.

After writing into the CGRAM, the AC is automatically incremented by 1 (or decremented by 1). After reading from the data, the RDM bit automatically updates or does not update the AC.

### Character Generator RAM (CGRAM)

The CGRAM serves as a RAM to store  $112 \times 80$ -dot bit pattern data in the graphics display mode. Here, display patterns are directly written into CGRAM. For details, see the Graphics Display section.

## **Timing Generator**

The timing generator generates timing signals for the operation of internal circuits such as the CGRAM. The RAM read timing for display and internal operation timing by MPU access are generated separately to avoid interference with one another. This prevents flickering in areas other than the display area when writing data to the CGRAM, for example.

## **Oscillation Circuit (OSC)**

The HD66740 can provide R-C oscillation simply through the addition of an external oscillation-resistor between the OSC1 and OSC2 pins. The appropriate oscillation frequency for operating voltage, display size, and frame frequency can be obtained by adjusting the external-resistor value. Clock pulses can also be supplied externally. Since R-C oscillation stops during the standby mode, current consumption can be reduced. For details, see the Oscillation circuit section.

## **Liquid Crystal Display Driver Circuit**

The liquid crystal display driver circuit consists of 80 common signal drivers (COM1 to COM80) and 112 segment signal drivers (SEG1 to SEG112). When the number of lines are selected by a program, the required common signal drivers automatically output drive waveforms, while the other common signal drivers continue to output unselected waveforms.

Graphics data is sent serially through a 112-bit shift register and latched when all needed data has arrived. The latched data then enables the segment signal drivers to generate drive waveform outputs.

The shift direction of 112-bit data can be changed by the SGS bit. The shift direction for the common driver can also be changed by the CMS bit by selecting an appropriate direction for the device mounting configuration.

When display is off, or during the standby or sleep mode, all the above common and segment signal drivers output the GND level, halting the display.

## **Booster (DC-DC Converter)**

The booster generates triple, quadruple, or five-times voltage input to the Vci pin. With this, both the internal logic units and LCD drivers can be controlled with a single power supply. Boost output level from triple to five-times boost can be selected by software. For details, see the Power Supply for Liquid Crystal Display Drive section.

## **V-Pin Voltage Follower**

A voltage follower for each voltage level (V1 to V5) reduces current consumption by the LCD drive power supply circuit. No external resistors are required because of the internal bleeder-resistor, which generates different levels of LCD drive voltage. This internal bleeder-resistor can be software-specified from 1/4 bias to 1/10 bias, according to the liquid crystal display drive duty value. The voltage followers can be turned off

while multiplexing drive is not being used. For details, see the Power Supply for Liquid Crystal Display Drive section.

### **Contrast Adjuster**

The contrast adjuster can be used to adjust LCD contrast in 64 steps by varying the LCD drive voltage by software. This can be used to select an appropriate LCD brightness or to compensate for temperature.

## CGRAM Address Map

Note: A set bit in CGRAM data 1 corresponds to display selection (lit) and 0 to non-selection (unlit).

## **Instructions**

### **Outline**

Only the instruction register (IR) and the data register (DR) of the HD66740 can be controlled by the MPU. Before starting internal operation of the HD66740, control information is temporarily stored in these registers to allow interfacing with various peripheral control devices or MPUs which operate at different speeds. The internal operation of the HD66740 is determined by signals sent from the MPU. These signals, which include the register selection signal (RS), the read/write signal (R/W), and the data bus signal (DB0 to DB7), make up the HD66740 instructions. There are four categories of instructions that:

- Control the display
- Control power management
- Set internal RAM addresses
- Transfer data with the internal RAM

Normally, instructions that perform data transfer with the internal RAM are used the most. However, auto-incrementation by 1 (or auto-decrementation by 1) of internal HD66740 RAM addresses after each data write can lighten the MPU program load.

Because instructions are executed in 0 cycle, instructions can be written in succession.

## Instruction Descriptions

### Start Oscillation

The start oscillation instruction restarts the oscillator from the halt state in the standby mode. After issuing this instruction, wait at least 10 ms for oscillation to stabilize before issuing the next instruction. (See the Standby Mode section.)

R/W	RS	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	1	1

**Figure 1 Start Oscillation Instruction**

### Driver Output Control

**CMS:** Selects the output shift direction of a common driver. When CMS = "0", COM1/80 shifts to COM1, and COM80/1 to COM80. When CMS = "1", COM1/80 shifts to COM80, and COM80/1 to COM1. Output position of a common driver shifts depending on the CN1-0 bit setting. For details, see the Display On/Off Control section.

**SGS:** Selects the output shift direction of a segment driver. When SGS = "0", SEG1/112 shifts to SEG1, and SEG112/1 to SEG112. When SGS = "1", SEG1/112 shifts SEG112, and SEG112/1 to SEG1.

0	0	0	0	0	0	0	1	<b>CMS</b>	<b>SGS</b>

**Figure 2 Driver Output Control Instruction**

**Power Control**

**AMP:** When AMP = 1, each voltage follower for V1 to V5 pins and the booster are turned on. When AMP = 0, current consumption can be reduced while the display is not being used.

**SLP:** When SLP = 1, the HD66740 enters the sleep mode, where the internal operations are halted except for the R-C oscillator, thus reducing current consumption. For details, see the Sleep Mode section. Only the power control (AMP, SLP, and STB bits) instruction can be executed during the sleep mode.

During the sleep mode, the other RAM data and instructions cannot be updated although they are retained.

**STB:** When STB = 1, the HD66740 enters the standby mode, where display operation completely stops, halting all the internal operations including the internal R-C oscillator. Further, no external clock pulses are supplied. For details, see the Standby Mode section.

Only the following instructions can be executed during the standby mode.

- a. Standby mode cancel (STB = 0)
- b. Voltage follower circuit on/off (AMP = 1/0)
- c. Start oscillation

During the standby mode, the other RAM data and instructions may be lost. To prevent this, they must be set again after the standby mode is canceled.

## Contrast Control 1/2

**SW:** Switches the bit configuration for the contrast control instruction.

**CT4–CT0:** When  $SW = 0$ , they control the LCD drive voltage (potential difference between V1 and GND) to adjust contrast. A 64-step adjustment is also possible by using the CT5 bit which are set in the entry mode register. For details, see the Contrast Adjuster section.

1	1	1	1	1	0	0.10 x R
1	1	1	1	1	1	0.05 x R

**BT1-0:** When SW = 1, they switch the output of V5OUT between triple, quadruple, and five-times boost. The liquid crystal display drive voltage level can be selected according to its drive duty ratio and bias. A lower amplification of the booster consumes less current.

**BS2-0:** When SW = 1, they set the crystal display drive bias value within the range of 1/4 to 1/10 bias. The liquid crystal display drive bias value can be selected according to its drive duty ratio and voltage. For details, see the Liquid Crystal Display Drive Bias Selector section.

**Table 7 BT Bits and Output Level**

BT1	BT0	V5OUT Output Level
0	0	Triple boost
0	1	Quadruple boost
1	0	Five-times boost
1	1	Setting inhibited

**Table 8 BS Bits and LCD Drive Bias Value**

BS2	BS1	BS0	Liquid Crystal Display Drive Bias Value
0	0	0	1/10 bias drive
0	0	1	1/9.5 bias drive
0	1	0	1/9 bias drive
0	1	1	1/8 bias drive
1	0	0	1/7 bias drive
1	0	1	1/6 bias drive
1	1	0	1/5 bias drive
1	1	1	1/4 bias drive

**Entry Mode**

**REV:** Displays all graphics display sections with black-and-white reversal when SW = 0 and REV = 1. For details, see the Reversed Display Function section.

**I/D:** When SW = 0, increments (I/D = 1) or decrements (I/D = 0) the CGRAM address by 1 when a data is written into or read from the CGRAM.

**CT5:** Sets the most significant bit (CT5) for contrast adjustment when SW = 1. A 64-step adjustment is also possible by using the CT4–CT0 bits which are set in the contrast-control 1/2 instruction.

**RDM:** When SW = 1 and RDM = 0, the RDM increments or decrements the address counter value according to the I/D bit setting after reading the data from the CGRAM. When RDM = 1, the address counter value is not updated after the data has been read from the CGRAM. The address counter value is used when the RAM data is read, modified, and written. Since the first read data is invalid, the read must be continuously done twice. After writing to the RAM, the address counter value must be updated.

**Figure 6 Entry Mode Set Instruction**

**Display On/Off Control**

**D:** Display is on when SW = 0 and D = 1 and off when D = 0. When off, the display data remains in the DDRAM or CGRAM, and can be displayed instantly by setting D = 1. When D is 0, the display is off with the SEG1 to SEG112 outputs and COM1 to COM80 outputs set to the GND level. Because of this, the HD66740 can control charging current for the LCD with AC driving.

**DL10:** When SW = 0, DL10 can be set. When DL10 = 1, the 10th line is displayed at double height.

**DL9–DL7:** When SW = 1, DL9–DL7 can be set. Double-height display is specified for any display line. When DL7 = 1, the seventh line is displayed at double height. Double-height display is used for the eighth line when DL8 = 1 and for the ninth line when DL9 = 1. For double-height display for the first to the sixth lines, control them by using DL1–DL6 bits in the display-line control instruction.

R/W	RS	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	
0	0	0	0	1	1	0	D	DL10	0	(SW = 0)
							DL9	DL8	DL7	(SW = 1)

**Figure 7 Display On/Off Control Instruction**

## Display Line Control

**NL3-0:** Set NL2–NL0 bits when SW = 0, and the NL3 bit when SW = 1 to specify the display lines. Display lines change the liquid crystal display drive duty ratio. CGRAM address mapping does not depend on the number of display lines.

R/W	RS	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	
0	0	0	0	1	1	1	NL2	NL1	NL0	(SW = 0)
							CN1	CN0	NL3	(SW = 1)

**Figure 8 Display-line Control Instruction**

**Table 9 NL Bits and Display Lines**

NL3	NL2	NL1	NL0	Graphics Display	LCD Drive Duty	Common Driver Used
0	0	0	0	112 x 8 dots	1/8 Duty	COM1–COM8
0	0	0	1	112 x 16 dots	1/16 Duty	COM1–COM16
0	0	1	0	112 x 24 dots	1/24 Duty	COM1–COM24
0	0	1	1	112 x 32 dots	1/32 Duty	COM1–COM32
0	1	0	0	112 x 40 dots	1/40 Duty	COM1–COM40
0	1	0	1	112 x 48 dots	1/48 Duty	COM1–COM48
0	1	1	0	112 x 56 dots	1/56 Duty	COM1–COM56
0	1	1	1	112 x 64 dots	1/64 Duty	COM1–COM64
1	0	0	0	112 x 72 dots	1/72 Duty	COM1–COM72
1	0	0	1	112 x 80 dots	1/80 Duty	COM1–COM80

**CN1–CN0:** Set CN1–CN0 bits when SW = 1. When CN1–0 = 01, the display position is shifted by 16 dots below and display starts from COM17. When the liquid crystal is driven at low duty in the system wait state, it can display partially at the center of the screen. For details, see the Partial-display-on Function section.

When CN1–CN0 = 10, the display position is shifted by 8 dots above and second-line display starts from COM1. The 8 dots of the first line are moved to the lowest edge of the display screen. The output position of the lowest edge depends on the drive duty setting. In vertical smooth scrolling, PS1–PS0 bits can selectively fixed-display only the first to the third lines. Combining these functions enables the fixed display of one line of the lowest edge. For details, see the Partial Smooth Scroll Display Function section.

**Table 10 Common Driver Pin Function**

**Double-height Display Control**

**DL3-1:** Can be specified when  $SW = 0$ . Specify the double-height display for any line. When  $DL1 = 1$ , the first line is displayed at double height. When  $DL2 = 1$ , the second line is displayed at double height. When  $DL3 = 1$ , the third line is displayed at double height. Double-height display of multiple lines is possible. For details, see the Double-height Display section.

**DL6-4:** Can be specified when  $SW = 1$ . Specify the double-height display for any line. When  $DL4 = 1$ , the fourth line is displayed at double height. When  $DL5 = 1$ , the fifth line is displayed at double height. When  $DL6 = 1$ , the sixth line is displayed at double height. For the seventh to 10th lines, control double-height display by using the  $DL7$ – $DL10$  bits in the display-line control instruction. For details, see the Double-height Display section.

							<b>DL6</b>	<b>DL5</b>	<b>DL4</b>	(SW = 1)

**Figure 9 Double-height Display Control Instruction**

**Vertical Scroll Control 1/2**

**SN3-0:** Set SN2 to SN0 bits when SW = 0. Set the SN3 bit when SW = 1. Specify the display start line output from COM1. Because the CGRAM is assigned a 10-line display area, the data is displayed sequentially from the first line to the 10th line then repeated from the first line again. In partial smooth scrolling, these bits specify the display start line for the next line of the fixed-display line. For details, see the Partial Smooth Scroll Display Function section.

**SL2-0:** Select the top raster-row to be displayed (display-start raster-row) in the display-start line specified by SN2 to SN0. Any raster-row from the first to eighth can be selected (table 12). This function is used to achieve vertical smooth scrolling together with SN2 to SN0. For details, see the Vertical Smooth Scroll section.

R/W	RS	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	
0	0	0	1	0	0	1	SN2	SN1	SN0	(SW = 0)
							<0>	<0>	SN3	(SW = 1)
0	0	0	1	0	1	0	SL2	SL1	SL0	(SW = 0)
							<0>	PS1	PS0	(SW = 1)

**Figure 10 Vertical Scroll Control 1/2 Instruction**

**Table 11 SN Bits and Display-start Lines**

SN3	SN2	SN1	SN0	Display-start Line
0	0	0	0	1st line
0	0	0	1	2nd line
0	0	1	0	3rd line
0	0	1	1	4th line
0	1	0	0	5th line
0	1	0	1	6th line
0	1	1	0	7th line
0	1	1	1	8th line
1	0	0	0	9th line
1	0	0	1	10th line

**Table 12 SL Bits and Display-start Raster-row**

SL2	SL1	SL0	Display-start Raster-row
0	0	0	1st raster-row
0	0	1	2nd raster-row
0	1	0	3rd raster-row
0	1	1	4th raster-row
1	0	0	5th raster-row
1	0	1	6th raster-row
1	1	0	7th raster-row
1	1	1	8th raster-row

**PS1-0:** Specify PS1 to PS0 bits when SW = 1. When PS1-0 = 01, only the first line is fixed-displayed in vertical smooth scrolling, and the other display lines are smooth-scrolled. When PS1-0 = 10, the first and second lines are fixed-displayed. When PS1-0 = 11, the first to third lines are fixed-displayed. For details, see the Partial Smooth Scroll Display Function section.

### LCD-Driving-Pattern Control

**B/C:** When SW=1 and B/C=0, a B-pattern waveform is generated and alternates in every frame for LCD drivin. When B/C=1, a C-pattern waveform is generated and alternates (n-raster-row reversed AC drive) in each raster-row specified by bits EOR and NW4-NW0 in the LCD-driving-waveform control register. For details, see the n-raster-row Reversed AC Drive section.

**DCC:** When SW=1 and DCC=0, a booster operates with the 64-divided clock of the operating frequency. When DCC=1, the booster operates with the 32-divided clock. When the booster operates with the 64-divided clock, current consumptionin the booster is low, but boosting ability is weak.

**Figure 10a LCD-Driving-Waveform Control Instruction**

### LCD-Driving-Waveform Control

**EOR:** When the C-pattern waveform is set (B/C = 1) and SW = 1 and EOR = 1, the odd/even frame-select signals and the n-raster-row reversed signals are EORed for alternating drive. EOR is used when the LCD is not alternated by combining the set values of the LCD drive duty ratio and n raster-row. For details, see the n-raster-row Reversed AC Drive section.

**NW4-0:** Specify the number of raster-rows  $n$  that will alternate at the C-pattern waveform setting (B/C = 1). NW4–NW0 alternate in every set value + 1 raster-row, and the first to the 32nd raster-rows can be selected. When SW = 0, bits NW2, NW1, and NW0 can be set. When SW = 1, bits NW4 and NW3 can be set.

R/W	RS	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	
0	0	0	1	1	1	1	NW2	NW1	NW0	(SW = 0)
							EOR	NW4	NW3	(SW = 1)

Figure 11 LCD-Driving-Waveform Control Instruction

**RAM Address Set**

**AD10-0:** Initially set RAM addresses to the address counter (AC). Once the RAM data is written, the AC is automatically updated according to the I/D bit. This allows consecutive accesses without resetting addresses. Once the RAM data is read, the AC is automatically updated according to the I/D bit when RDM = 0, and not updated when RDM = 1. Set RDM to 1 when read, modify, and write are done in every one-byte data. RAM address setting is not allowed in the sleep mode or standby mode.

**Figure 13 Write Data to RAM Instruction**

**Read Data from RAM**

**RD7-0** : Read 8-bit data from the CGRAM. In the parallel bus interface mode, the first-byte data read will be invalid immediately after the RAM address set, and the consecutive second-byte data will be read normally. In the serial interface mode or I2C bus interface mode, two bytes will be invalid immediately after the start byte, and the consecutive third-byte data will be read normally. For details, see the Serial Data Transfer section.

After a RAM read, when RDM = 0, the address is automatically incremented or decremented by 1 according to the I/D bit. When RDM = 1, the address is not updated.

DCC = 0: Boosted at 1/64-divided clock

DCC = 1: Boosted at 1/32-divided clock

AD10-0: CGRAM address set (CGRAM: 000H-4EFH)

## Reset Function

The HD66740 is internally initialized by RESET input. The reset input must be held for at least 1 ms.

### Instruction Set Initialization:

1. Start oscillation executed
2. Driver output control (SGS = 0, CMS = 0)
3. Power control (AMP = 0: LCD power off, SLP = 0: Sleep mode off, STB = 0: Standby mode off)
4. Three times boost (BT1/0 = 00), 1/10 bias drive (BS2/1/0 = 000), Weak contrast (CT5-0 = 00000)
5. Entry mode set (REV = 0: Normal display, I/D = 1: Increment by 1, RDM = 0: Automatically update after reading)
6. Display on/off control (D = 0: Display off, CEN = 0: Normal position)
7. Display line control (NL3/2/1/0 = 1001: 1/80 duty ratio)
8. Double-height display off (DL10-1 = 0000000000)
9. Vertical scroll control (SN3/2/1/0 = 0000: First line displayed at the top, SL2/1/0: First raster-row displayed at the top of the first line, PS1/0 = 00: Partial scroll off)
10. 1/64-divided clock boost (DCC = 0)
11. B-pattern waveform AC drive (B/C = 0, EOR = 0, NW4/3/2/1/0 = 00000)

### RAM Data Initialization:

1. CGRAM

This is not automatically initialized by reset input but must be initialized by software while display is off (D = 0).

### Output Pin Initialization:

1. LCD driver output pins (SEG/COM): Outputs GND level
2. Booster output pins (VLOUT): Outputs GND level
3. Oscillator output pin (OSC2): Outputs oscillation signal

## Serial Data Transfer (Clock synchronized serial interface)

Setting the IM1 and IM2 pins (interface mode pins) to the GND level allows standard clock-synchronized serial data transfer, using the chip select line (CS\*), serial data line (SDA), and serial transfer clock line (SCL). For a serial interface, the IM0/ID pin function uses an ID pin.

The HD66740 initiates serial data transfer by transferring the start byte at the falling edge of CS\* input. It ends serial data transfer at the rising edge of CS\* input.

The HD66740 is selected when the 6-bit chip address in the start byte transferred from the transmitting device matches the 6-bit device identification code assigned to the HD66740. The HD66740, when selected, receives the subsequent data string. The least significant bit of the identification code can be determined by the ID pin. The five upper bits must be 01110. Two different chip addresses must be assigned to a single HD66740 because the seventh bit of the start byte is used as a register select bit (RS): that is, when RS = 0, an instruction can be issued, and when RS = 1, data can be written to or read from RAM. Read or write is selected according to the eighth bit of the start byte (R/W bit) as shown in table 16.

After receiving the start byte, the HD66740 receives or transmits the subsequent data byte-by-byte. The data is transferred with the MSB first.

Two bytes of RAM read data after the start byte are invalid. The HD66740 starts to read correct RAM data from the third byte.

**Table 15 Start Byte Format**

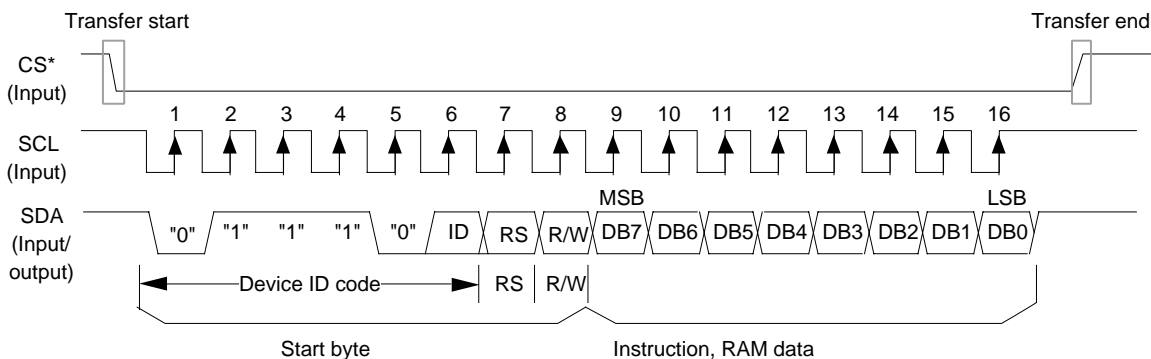

Transfer Bit	S	1	2	3	4	5	6	7	8
Start byte format	Transfer start	Device ID code						RS	R/W
		0	1	1	1	0	ID		

Note: ID bit is selected by the IM0/ID pin.

0	1	—
1	0	Writes RAM data
1	1	Reads RAM data

a) Basic Data-transfer Timing through Clock-synchronized Serial Bus Interface

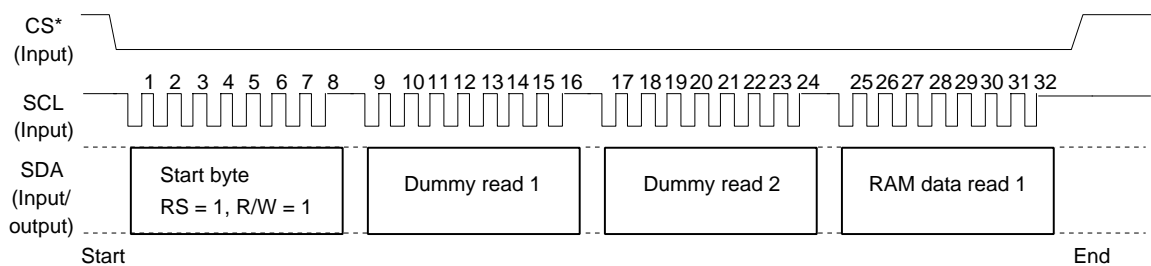

b) Consecutive Data-transfer Timing through Clock-synchronized Serial Bus Interface

Note: When instruction 1 is a clear display instruction, adjust the transfer rate so that the 8th bit of instruction 2 is transferred after execution of the clear display instruction.

c) RAM Data Read-transfer Timing

Note: Two bytes of the RAM read data after the start byte are invalid. The HD66740 starts to read the correct RAM data from the third byte.

Figure 16 Clock-synchronized Serial Interface Timing Sequence

## Serial Data Transfer (I2C bus interface)

Setting the IM2=Vcc and IM1=GND level allows I2C bus interface, using the serial data line (SDA) and serial transfer clock line (SCL). For the I2C bus interface, the IM0/ID pin function uses an ID pin.

The HD66740W is initiated serial data transfer by transferring the first byte when a high SCL level at the falling edge of the SDA input is sampled; it ends serial data transfer when a high SCL level at the rising edge of the SDA input is sampled.

Table 16-a illustrates the start byte of I2C bus interface data and Figure 16-a and 16-b show the I2C bus interface timing sequence.

The HD66740W is selected when the higher 6-bit slave address in the first byte transferred from the master device match the 6-bits device identification code assigned to the HD66740W. The HD66740W, when selected, receive the subsequent data string. The lower 1-bit of the device identification code can be determined by the ID pin; select an appropriate code that is not assigned to any other slave device. The upper five bits are fixed to 01110. One slave address is assigned to a single HD66740W.

The ninth bit of the first byte is a receive-data acknowledge bit (ACK). When the received slave address matches the device ID code, HD66740W pulls down the ACK bit to a low level. Therefore, the ACK output buffer is an open-drain structure, only allowing low-level output. However, the ACK bit is undermined immediately after power-on; make sure to initialize the LSI using the RESET\* input.

After identifying the address in the first byte, the HD66740W receives the subsequent data as an HD66740W instruction or as RAM data. Having received 8-bit data normally, HD66740W pulls down the ninth bit (ACK) to a low level. The instruction or RAM data is 8-bits data format.

Two bytes of RAM read data after the start byte are invalid. The HD66740W start to read correct RAM data from third byte.

**Table 16-a Start Byte Format**

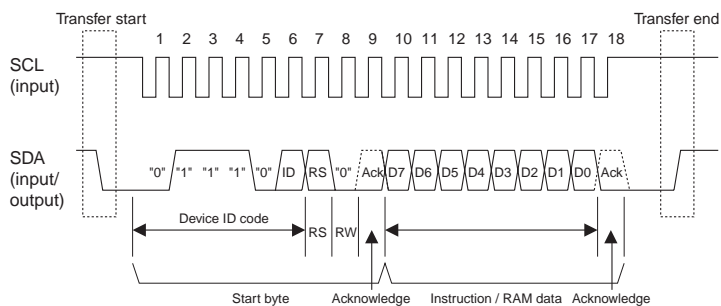

Transfer Bit	S	1	2	3	4	5	6	7	8	9
Start byte format	Transfer start	Device ID code						RS	R/W	ACK
		0	1	1	1	0	ID			

Note: ID bit is selected by the IM0/ID pin.

## Parallel Data Transfer

### 8-bit Bus Interface

Setting the IM2/1/0 (interface mode) to the GND/Vcc/GND level allows E-clock-synchronized 8-bit parallel data transfer. Setting the IM2/1/0 (interface mode) to the Vcc/Vcc/GND level allows 80-system 8-bit parallel data transfer. When the number of buses or the mounting area is limited, use a 4-bit bus interface or serial data transfer.

**Figure 17 Interface to 8-bit Microcomputer**

### 4-bit Bus Interface

Setting the IM2/1/0 (interface mode) to the GND/Vcc/Vcc level allows E-clock-synchronized 4-bit parallel data transfer using pins DB7-DB4. Setting the IM2/1/0 (interface mode) to the Vcc/Vcc/Vcc level allows 80-system 4-bit parallel data transfer. The 8-bit instructions and RAM data are divided into four upper/lower bits and the transfer starts from the upper four bits.

Note: Transfer synchronization function for a 4-bit bus interface

The HD66740 supports the transfer synchronization function which resets the upper/lower counter to count upper/lower 4-bit data transfer in the 4-bit bus interface. Noise causing transfer mismatch between the four upper and lower bits can be corrected by a reset triggered by consecutively writing a 0000 instruction four times. The next transfer starts from the upper four bits. Executing synchronization function periodically can recover any runaway in the display system.

**Figure 18 4-bit Transfer Synchronization**

## Oscillation Circuit

The HD66740 can either be supplied with operating pulses externally (external clock mode) or oscillate using an internal R-C oscillator with an external oscillator-resistor (external resistor oscillation mode). Note that in R-C oscillation, the oscillation frequency is changed according to the internal capacitance value, the external resistance value, or operating power-supply voltage. Insert the dumping resistance of about 1.5kΩ to prevent malfunctions caused by over-shoot or under-shoot noise in the external clock mode.

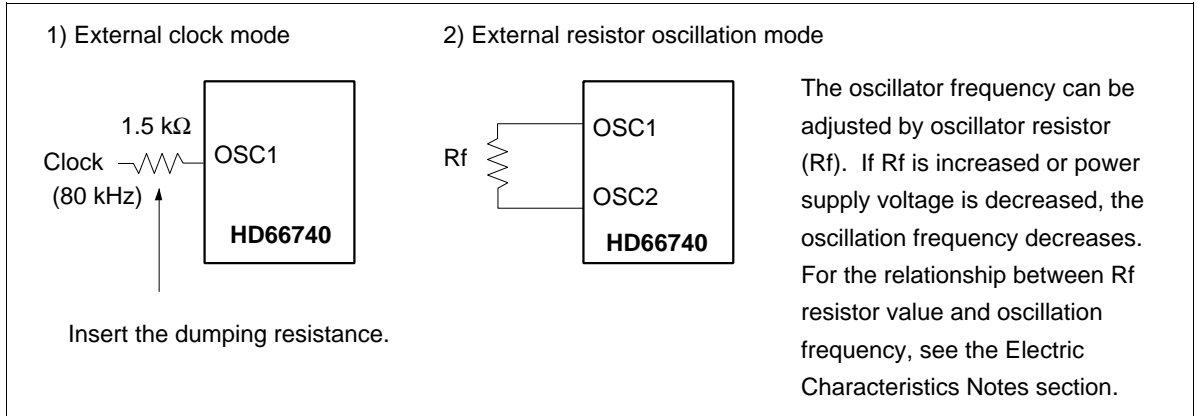

Figure 19 Oscillation Circuits

Table 17 Relationship between Drive Duty Ratio and Frame Frequency (fosc = 75 kHz)

LCD Drive	Display mode									
	1-line Display	2-line Display	3-line Display	4-line Display	5-line Display	6-line Display	7-line Display	8-line Display	9-line Display	10-line Display
	Set value for NL3-0									
Multiplexing duty ratio	1/8	1/16	1/24	1/32	1/40	1/48	1/56	1/64	1/72	1/80
Drive bias (recommended value)	1/4	1/5	1/6	1/6	1/7	1/8	1/8	1/9	1/9.5	1/10
Frame frequency	73 Hz	73 Hz	73 Hz	73 Hz	72 Hz	74 Hz	74 Hz	73 Hz	65 Hz	59 Hz
One-frame frequency	1,024	1,024	1,032	1,024	1,040	1,008	1,008	1,024	1,152	1,280

Note: If the frame frequency is low and the display flickers, increase the oscillation frequency (fosc). Particularly in the 9-line display and 10-line display modes, note that the frame frequency is lowered.

Figure 20 LCD Drive Output Waveform (B-pattern AC Drive with 1/80 Multiplexing Duty Ratio)

### n-raster-row Reversed AC Drive

The HD66740 supports not only the LCD reversed AC drive in a one-frame unit (B-pattern waveform) but also the n-raster-row reversed AC drive which alternates in an n-raster-row unit from one to 32 raster-rows (C-pattern waveform). When a problem affecting display quality occurs, such as crosstalk at high-duty driving of more than five lines (1/40 duty), the n-raster-row reversed AC drive (C-pattern waveform) can improve the quality. Determine the number of raster-rows  $n$  (NW bit set value + 1) for alternating after confirmation of the display quality with the actual LCD panel. However, if the number of AC raster-rows is reduced, the LCD alternating frequency becomes high. Because of this, the charge or discharge current is increased in the LCD cells.

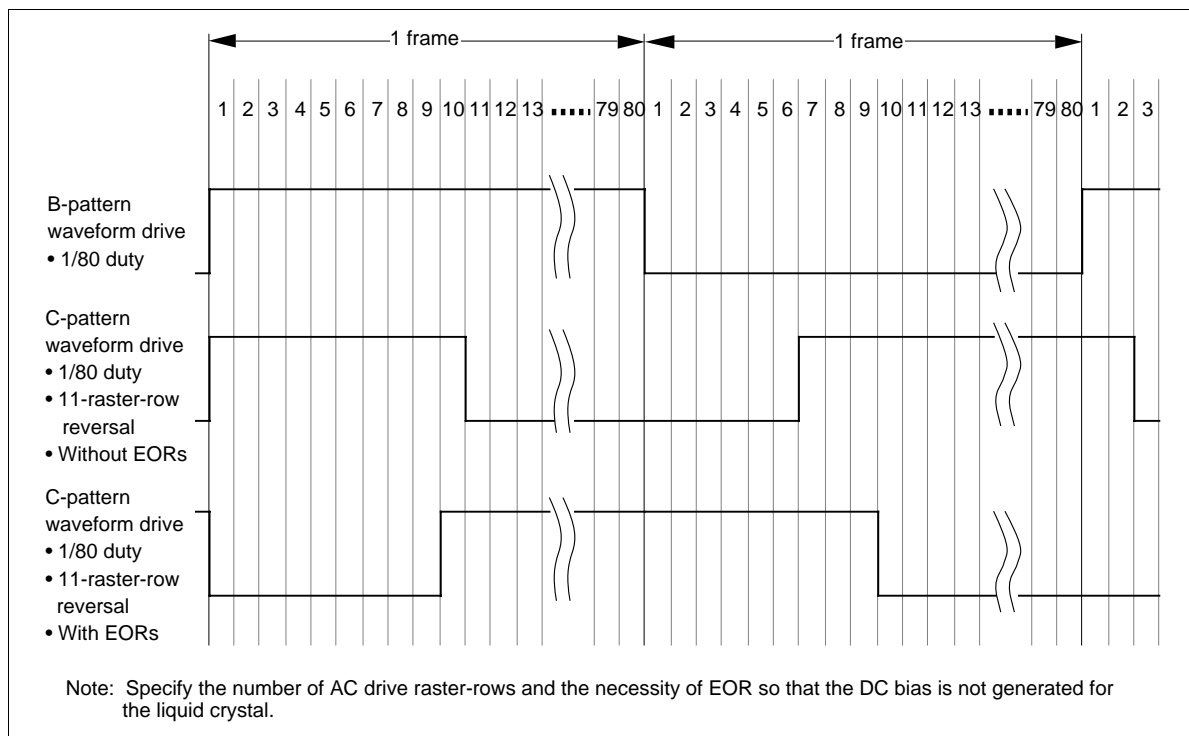

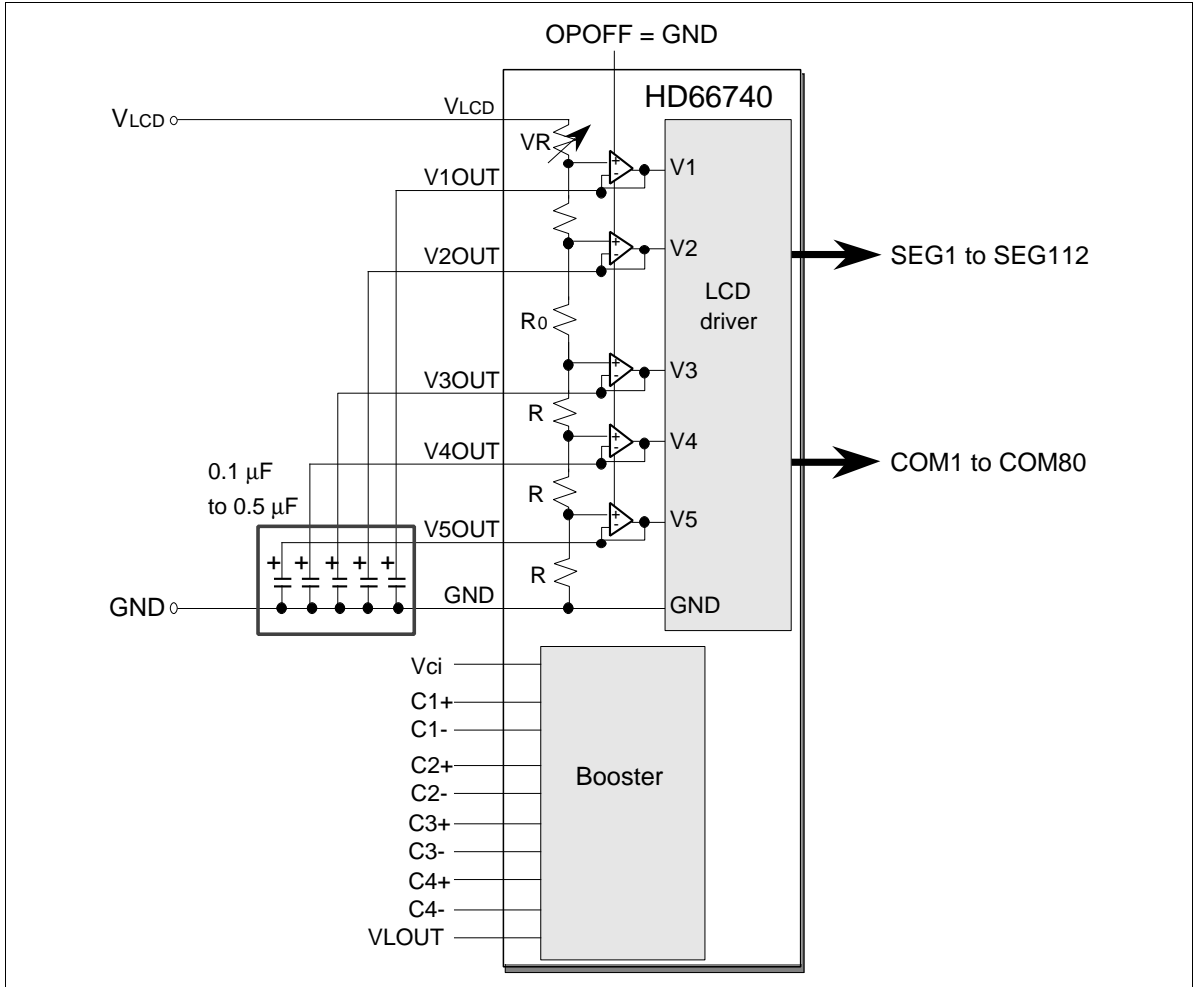

Figure 21 Example of an AC Signal under n-raster-row Reversed AC Drive

**Liquid Crystal Display Voltage Generator****When External Power Supply and Internal Operational Amplifiers are Used**

To supply LCD drive voltage directly from the external power supply without using the internal booster, circuits should be connected as shown in figure 22. Here, contrast can be adjusted by software through the CT bits of the contrast adjustment register.

The HD66740 incorporates a voltage-follower operational amplifier for each V1 to V5 to reduce current flowing through the internal bleeder-resistors, which generate different levels of liquid-crystal drive voltages. Thus, potential differences between VLCD and V1 and between V5 and GND must be 0.4 V or higher. Note that the OPOFF pin must be grounded when using the operational amplifiers. Place a capacitor of about 0.1  $\mu$ F to 0.5  $\mu$ F between each internal operational amplifier V1OUT to V5OUT output and GND and stabilize the output level of the operational amplifier.

**Figure 22 External Power Supply Circuit for LCD Drive Voltage Generation**

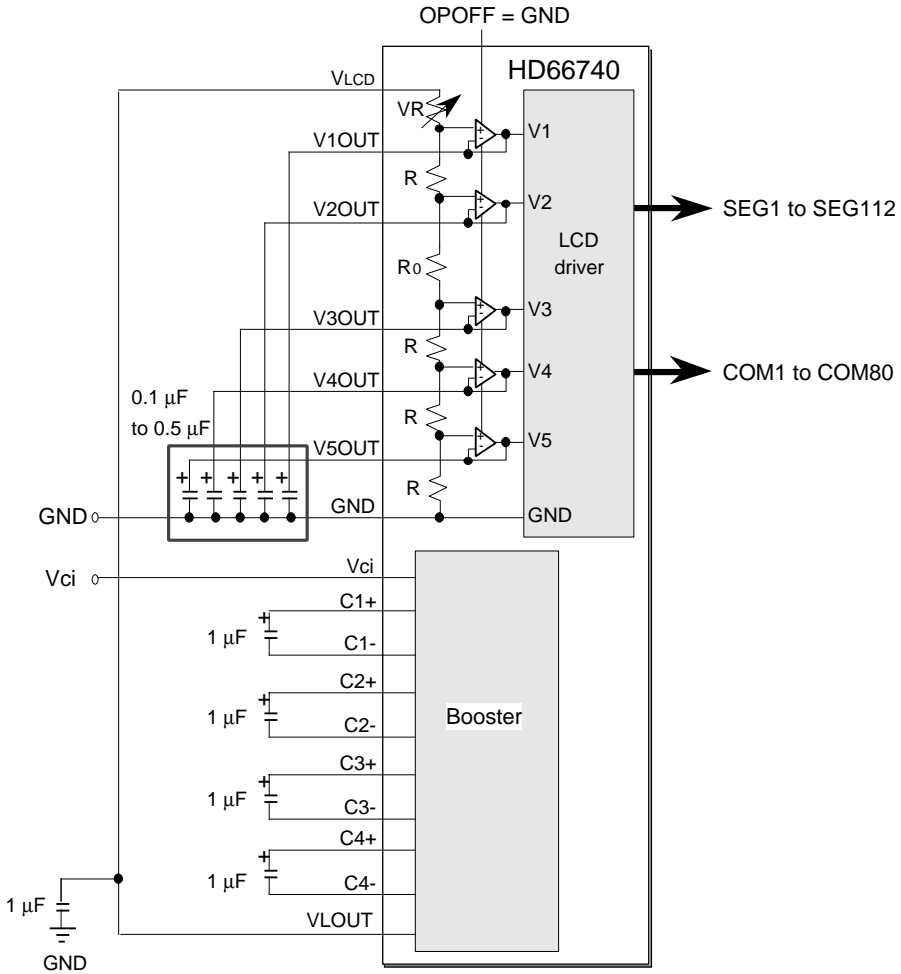

### **When an Internal Booster and Internal Operational Amplifiers are Used**

To supply LCD drive voltage using the internal booster, circuits should be connected as shown in figure 23. Here, contrast can be adjusted through the CT bits of the contrast control instruction. Temperature can be compensated either through the CT bits or by controlling the reference voltage for the booster (Vci pin) using a thermistor.

Note that Vci is both a reference voltage and power supply for the booster. The reference voltage must therefore be adjusted using an emitter-follower or a similar element so that sufficient current can be supplied. In this case, Vci must be equal to or smaller than the  $V_{CC}$  level.

The HD66740 incorporates a voltage-follower operational amplifier for each of V1 to V5 to reduce current flowing through the internal bleeder-resistors, which generate different liquid-crystal drive voltages. Thus, the potential differences between  $V_{LCD}$  and V1 and between V5 and GND must be 0.4 V or higher.

Note that the OPOFF pin must be grounded when using the operational amplifiers. Place a capacitor of about 0.1  $\mu$ F to 0.5  $\mu$ F between each internal operational amplifier V1OUT to V5OUT output and GND and stabilize the output level of the operational amplifier.

- Notes:
1. The reference voltage input ( $V_{ci}$ ) must be adjusted so that the output voltage after boosting will not exceed the absolute maximum rating for the liquid-crystal power supply voltage (17 V). Particularly,  $V_{ci}$  must be 3.3 V or less for five-times boosting.
  2.  $V_{ci}$  is both a reference voltage and power supply for the booster; connect it to  $V_{cc}$  directly or combine it with a transistor so that sufficient current can be obtained.
  3. Polarized capacitors must be connected correctly.
  4. Circuits for temperature compensation should be based on the sample circuit in figure 24.

Figure 23 Internal Booster for LCD Drive Voltage Generation

Figure 24 Temperature Compensation Circuit

### Notes on Using Internal Operational Amplifier

The HD66740 has a low-current-consumption-type operational amplifier. When a low-voltage supply is used, particularly at low temperatures near  $-20^{\circ}\text{C}$ , the current in the operational amplifier is reduced. Therefore, depending on the specifications or display pattern of the LCD panel used, screen quality may be poor or the LCD panel may not operate at all.

For the operational specifications of the LCD panel, one must consider the drive condition (setting of the VTEST pin) or the peripheral circuits of the LCD panel in conjunction with the power-supply voltage.

Pin condition for HD66740 (setting VTEST pin):

1. When the power-supply voltage is  $V_{CC} \geq 2.5\text{ V}$  (i.e., the current in the operational amplifier is sufficient), leave the VTEST pin open (disconnected).
2. When the power-supply voltage is  $V_{CC} < 2.5\text{ V}$  (i.e., the current is reduced in the operational amplifier at low temperature), 1.2 to 1.3 V should be input to the VTEST pin.

The following table and figure correspond to inputs of 1.2 to 1.3 V to the VTEST pin. When higher LCD drive current is required due to the characteristics of the LCD panel, check the screen quality and current consumption, adjust the resistance values (R1 and R2), and increase the VTEST pin voltage. (This is also valid when  $V_{CC} \geq 2.5\text{ V}$ .)

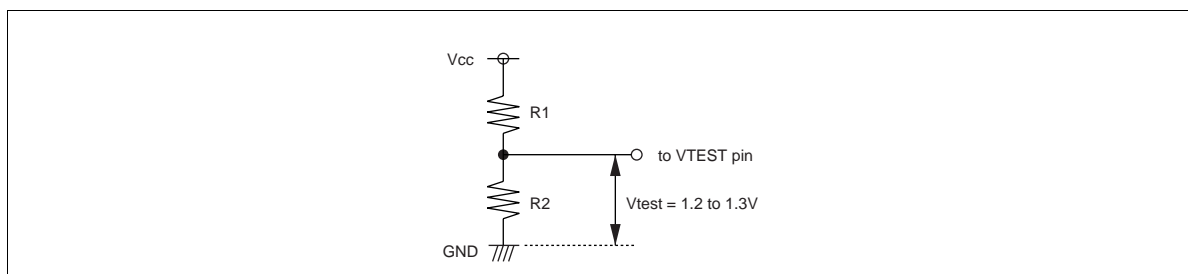

Figure 24-a Circuit to for Generating VTEST Pin Voltage

Table 17-a Settings to Generate VTEST Pin Voltage

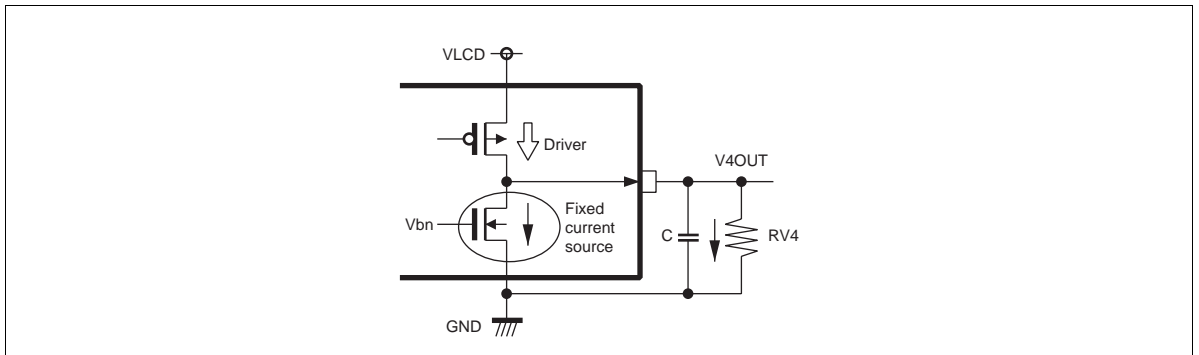

Vcc	R1	R2	Vtest (VTEST Pin Voltage)
2.4 V	270 k $\Omega$	330 k $\Omega$	1.23 V
2.0 V	220 k $\Omega$	360 k $\Omega$	1.22 V
1.8 V	180 k $\Omega$	390 k $\Omega$	1.22 V

**Countermeasures for Screen Quality when Using On-chip Operational Amplifier**

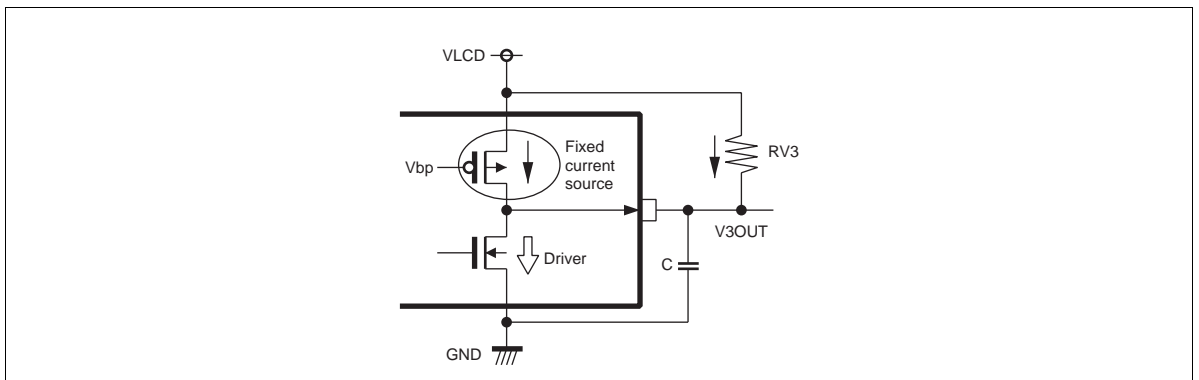

The HD66740 is an on-chip LCD driver that has an LCD power supply for high duty. Screen quality is affected by the load current of the high-duty LCD panel used. When the bias (1/10 bias, 1/9.5 bias, 1/9 bias, etc.) is high and the displayed pattern is completely or almost completely white, the white sections may appear dark.

If this happens, execute the following countermeasures to improve screen quality.

- (1) After the change in the V4OUT/V3OUT level is verified, insert about 1 M $\Omega$  between V4OUT and GND or VLCD and V3OUT and then adjust the screen quality (see the following figures). By inserting resistance, the current consumption increases as much as the boosting factor of the resistance current. Adjust the resistance after checking the screen quality and the increase in current consumption.
- (2) Decrease the drive bias and use the new bias level after verifying that the potential differences between V4OUT and GND or VLCD and V3OUT are sufficient.

**Figure 24-b Countermeasure for V4OUT Output**

**Figure 24-c Countermeasure for V3OUT Output**

Note: The actual LCD drive voltage-VLCD used must not exceed 15.0 V, and the absolute rating must not exceed 16.0 V.

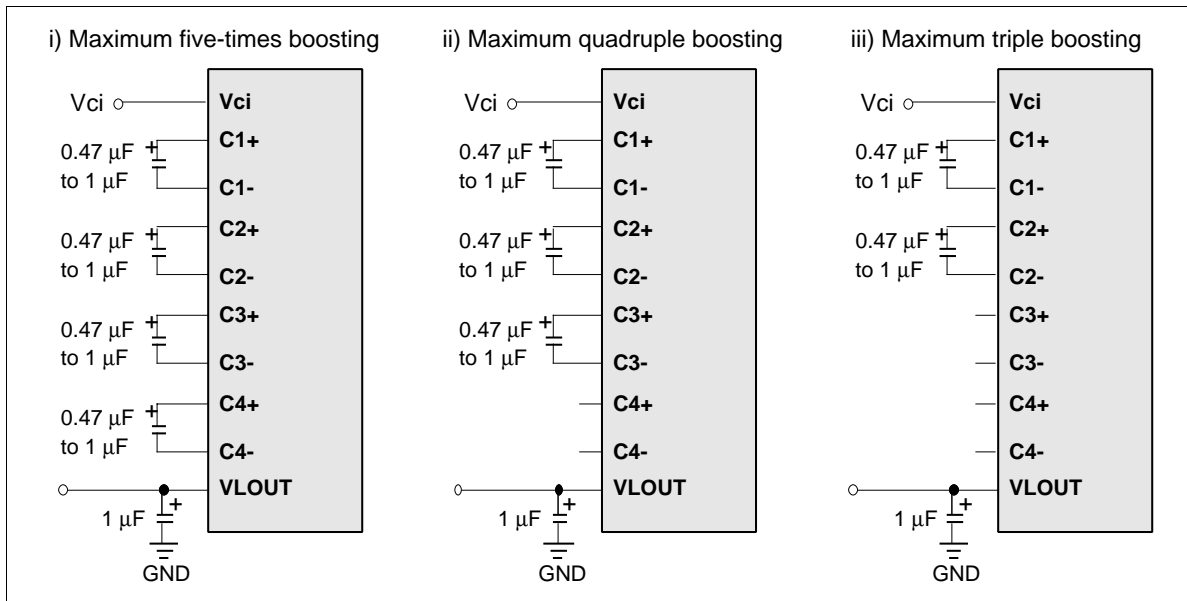

### Switching the Boosting Multiplying Factor

Instruction bits (BT1/0 bits) can optionally select the boosting multiplying factor of the internal booster. According to the display status, power consumption can be reduced by changing the LCD drive duty and the LCD drive bias, and by controlling the boosting multiplying factor for the minimum requirements. For details, see the Partial-display-on Function section.

Due to the maximum boosting multiplying factor, the following external capacitor needs to be connected. For example, when the maximum boosting is quadrupled, the capacitors between C4+ and C4- for five-times boosting are not needed, so these pins must be open.

**Table 18 VLOUT Output Status**

BT1	BT0	VLOUT Output Status
0	0	Triple boosting output
0	1	Quadruple boosting output
1	0	Five-times boosting output
1	1	Setting inhibited

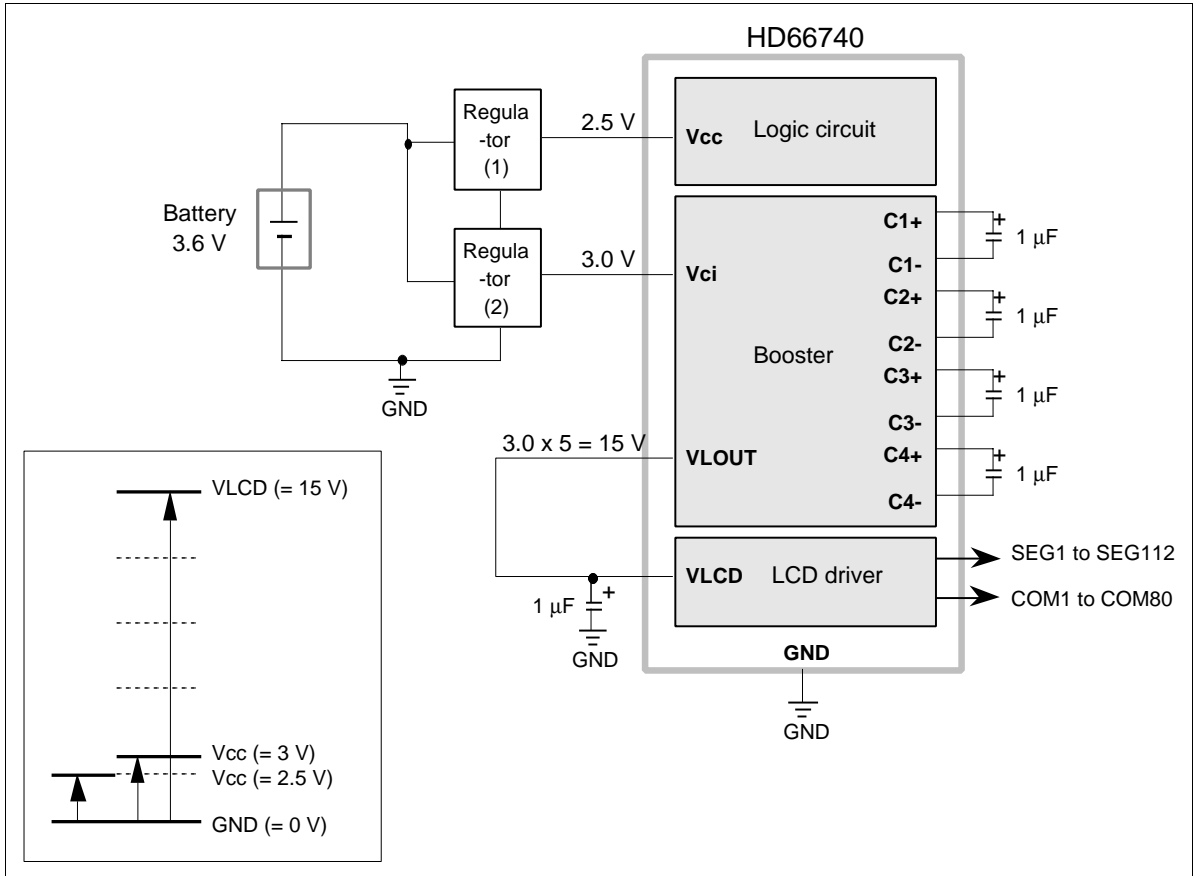

**Figure 25 Booster Output Multiplying Factor Switching**

## Example of Power-supply Voltage Generator for More Than Five-times Boosting Output

The HD66740 incorporates the booster for up to five-times boosting. However, the LCD drive voltage (VLCD) will not be enough for five-times boosting from  $V_{cc}$  when the power-supply voltage of  $V_{cc}$  is low or when the LCD drive voltage is high for the high-contrast LCD display. In this case, the reference voltage ( $V_{ci}$ ) for boosting can be set higher than the power-supply voltage of  $V_{cc}$ .

Set the  $V_{ci}$  input voltage for the booster to 3.6 V or less within the range of  $V_{cc} + 1.0$  V. Control the  $V_{ci}$  voltage so that the boosting output voltage (VLOUT) should be less than the absolute maximum ratings (17 V).

### Contrast Adjuster

Software can adjust 64-step contrast for an LCD by varying the liquid-crystal drive voltage (potential difference between  $V_{LCD}$  and  $V1$ ) through the CT bits of the contrast adjustment register (electron volume function). The value of a variable resistor between  $V_{LCD}$  and  $V1$  (VR) can be precisely adjusted in a  $0.05 \times R$  unit within a range from  $0.05 \times R$  through  $3.20 \times R$ , where R is a reference resistance obtained by dividing the total resistance.

The HD66740 incorporates a voltage-follower operational amplifier for each of  $V1$  to  $V5$  to reduce current flowing through the internal bleeder resistors, which generate different liquid-crystal drive voltages. Thus, CT5-0 bits must be adjusted so that the potential differences between  $V_{LCD}$  and  $V1$  and between  $V5$  and GND are 0.4 V or higher when liquid-crystal drives, particularly when the VR is small.

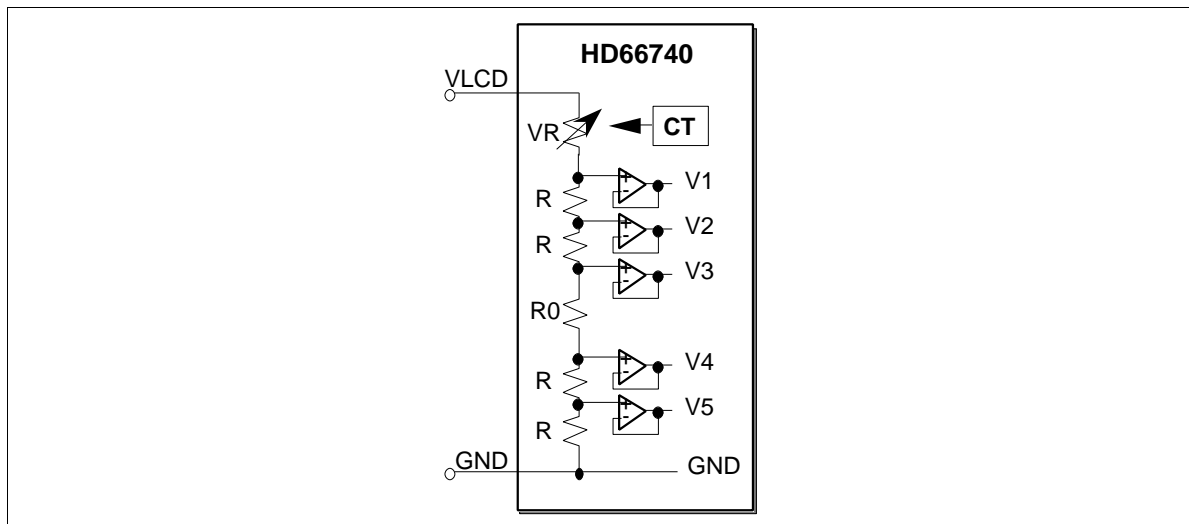

Figure 27 Contrast Adjuster

**Table 19 Contrast Adjustment Bits (CT) and Variable Resistor Values**

CT Set Value						Variable Resistor Value (VR)	Potential Difference between V1 and GND	Display Color		
CT5	CT4	CT3	CT2	CT1	CT0					
0	0	0	0	0	0	3.20 x R				
0	0	0	0	0	1	3.15 x R				
0	0	0	0	1	0	3.10 x R				
0	0	0	0	1	1	3.05 x R

**Table 20 Contrast Adjustment per Bias Drive Voltage**

Bias	LCD drive voltage: V <sub>DR</sub>	Contrast adjustment range
1/10 bias drive	$\frac{10 \times R}{10 \times R + VR} \times (V_{LCD} - GND)$	- LCD drive voltage adjustment range : $0.757 \times (V_{LCD}-GND) \leq V_{DR} \leq 0.995 \times (V_{LCD}-GND)$ - Limit of potential difference between V5 and GND : $\frac{R}{10 \times R + VR} \times (V_{LCD}-GND) \geq 0.4 [V]$ - Limit if potential difference between VLCD and V1 : $\frac{VR}{10 \times R + VR} \times (V_{LCD}-GND) \geq 0.4 [V]$
1/9.5 bias drive	$\frac{9.5 \times R}{9.5 \times R + VR} \times (V_{LCD} - GND)$	- LCD drive voltage adjustment range : $0.748 \times (V_{LCD}-GND) \leq V_{DR} \leq 0.994 \times (V_{LCD}-GND)$ - Limit of potential difference between V5 and GND : $\frac{R}{9.5 \times R + VR} \times (V_{LCD}-GND) \geq 0.4 [V]$ - Limit if potential difference between VLCD and V1 : $\frac{VR}{9.5 \times R + VR} \times (V_{LCD}-GND) \geq 0.4 [V]$
1/9 bias drive	$\frac{9 \times R}{9 \times R + VR} \times (V_{LCD} - GND)$	- LCD drive voltage adjustment range : $0.737 \times (V_{LCD}-GND) \leq V_{DR} \leq 0.994 \times (V_{LCD}-GND)$ - Limit of potential difference between V5 and GND : $\frac{R}{9 \times R + VR} \times (V_{LCD}-GND) \geq 0.4 [V]$ - Limit if potential difference between VLCD and V1 : $\frac{VR}{9 \times R + VR} \times (V_{LCD}-GND) \geq 0.4 [V]$
1/8 bias drive	$\frac{8 \times R}{8 \times R + VR} \times (V_{LCD} - GND)$	- LCD drive voltage adjustment range : $0.714 \times (V_{LCD}-GND) \leq V_{DR} \leq 0.993 \times (V_{LCD}-GND)$ - Limit of potential difference between V5 and GND : $\frac{R}{8 \times R + VR} \times (V_{LCD}-GND) \geq 0.4 [V]$ - Limit if potential difference between VLCD and V1 : $\frac{VR}{8 \times R + VR} \times (V_{LCD}-GND) \geq 0.4 [V]$
1/7 bias drive	$\frac{7 \times R}{7 \times R + VR} \times (V_{LCD} - GND)$	- LCD drive voltage adjustment range : $0.686 \times (V_{LCD}-GND) \leq V_{DR} \leq 0.993 \times (V_{LCD}-GND)$ - Limit of potential difference between V5 and GND : $\frac{R}{7 \times R + VR} \times (V_{LCD}-GND) \geq 0.4 [V]$ - Limit if potential difference between VLCD and V1 : $\frac{VR}{7 \times R + VR} \times (V_{LCD}-GND) \geq 0.4 [V]$
1/6 bias drive	$\frac{6 \times R}{6 \times R + VR} \times (V_{LCD} - GND)$	- LCD drive voltage adjustment range : $0.652 \times (V_{LCD}-GND) \leq V_{DR} \leq 0.992 \times (V_{LCD}-GND)$ - Limit of potential difference between V5 and GND : $\frac{R}{6 \times R + VR} \times (V_{LCD}-GND) \geq 0.4 [V]$ - Limit if potential difference between VLCD and V1 : $\frac{VR}{6 \times R + VR} \times (V_{LCD}-GND) \geq 0.4 [V]$
1/5 bias drive	$\frac{5 \times R}{5 \times R + VR} \times (V_{LCD} - GND)$	- LCD drive voltage adjustment range : $0.610 \times (V_{LCD}-GND) \leq V_{DR} \leq 0.990 \times (V_{LCD}-GND)$ - Limit of potential difference between V5 and GND : $\frac{R}{5 \times R + VR} \times (V_{LCD}-GND) \geq 0.4 [V]$ - Limit if potential difference between VLCD and V1 : $\frac{VR}{5 \times R + VR} \times (V_{LCD}-GND) \geq 0.4 [V]$
1/4 bias drive	$\frac{4 \times R}{4 \times R + VR} \times (V_{LCD} - GND)$	- LCD drive voltage adjustment range : $0.556 \times (V_{LCD}-GND) \leq V_{DR} \leq 0.988 \times (V_{LCD}-GND)$ - Limit of potential difference between V5 and GND : $\frac{R}{4 \times R + VR} \times (V_{LCD}-GND) \geq 0.4 [V]$ - Limit if potential difference between VLCD and V1 : $\frac{VR}{4 \times R + VR} \times (V_{LCD}-GND) \geq 0.4 [V]$

**Liquid Crystal Display Drive Bias Selector**

An optimum liquid crystal display bias value can be selected using BS2-0 bits, according to the liquid crystal drive duty ratio setting (NL3-0 bits). Liquid crystal display drive duty ratio and bias value can be displayed while switching software applications to match the LCD panel display status. The optimum bias value calculated using the following expression is an ideal value where the optimum contrast is obtained. Driving by using a lower value than the optimum bias value provides lower contrast and lower liquid crystal display voltage (potential difference between V1 and GND). When the liquid crystal display voltage is insufficient even if a five-times booster is used or output voltage is lowered because the battery life has been reached, the display can be made easier to see by lowering the liquid crystal bias.

The liquid crystal display can be adjusted by using the contrast adjustment register (CT4-0 bits) and selecting the booster output level (BT1/0 bits).

$$\text{Optimum bias value for } 1/N \text{ duty ratio drive voltage} = \frac{1}{\sqrt{N+1}}$$

**Table 21 Optimum Drive Bias Values**

LCD drive duty ratio	1/80	1/72	1/64	1/56	1/48	1/40	1/32	1/24	1/16	1/8
(NL3-0 set value)	1001	1000	0111	0110	0101	0100	0011	0010	0001	0000
Optimum drive bias value	1/10	1/9.5	1/9	1/8	1/8	1/7	1/6	1/6	1/5	1/4
(BS2-0 set value)	000	001	010	011	011	100	101	101	110	111

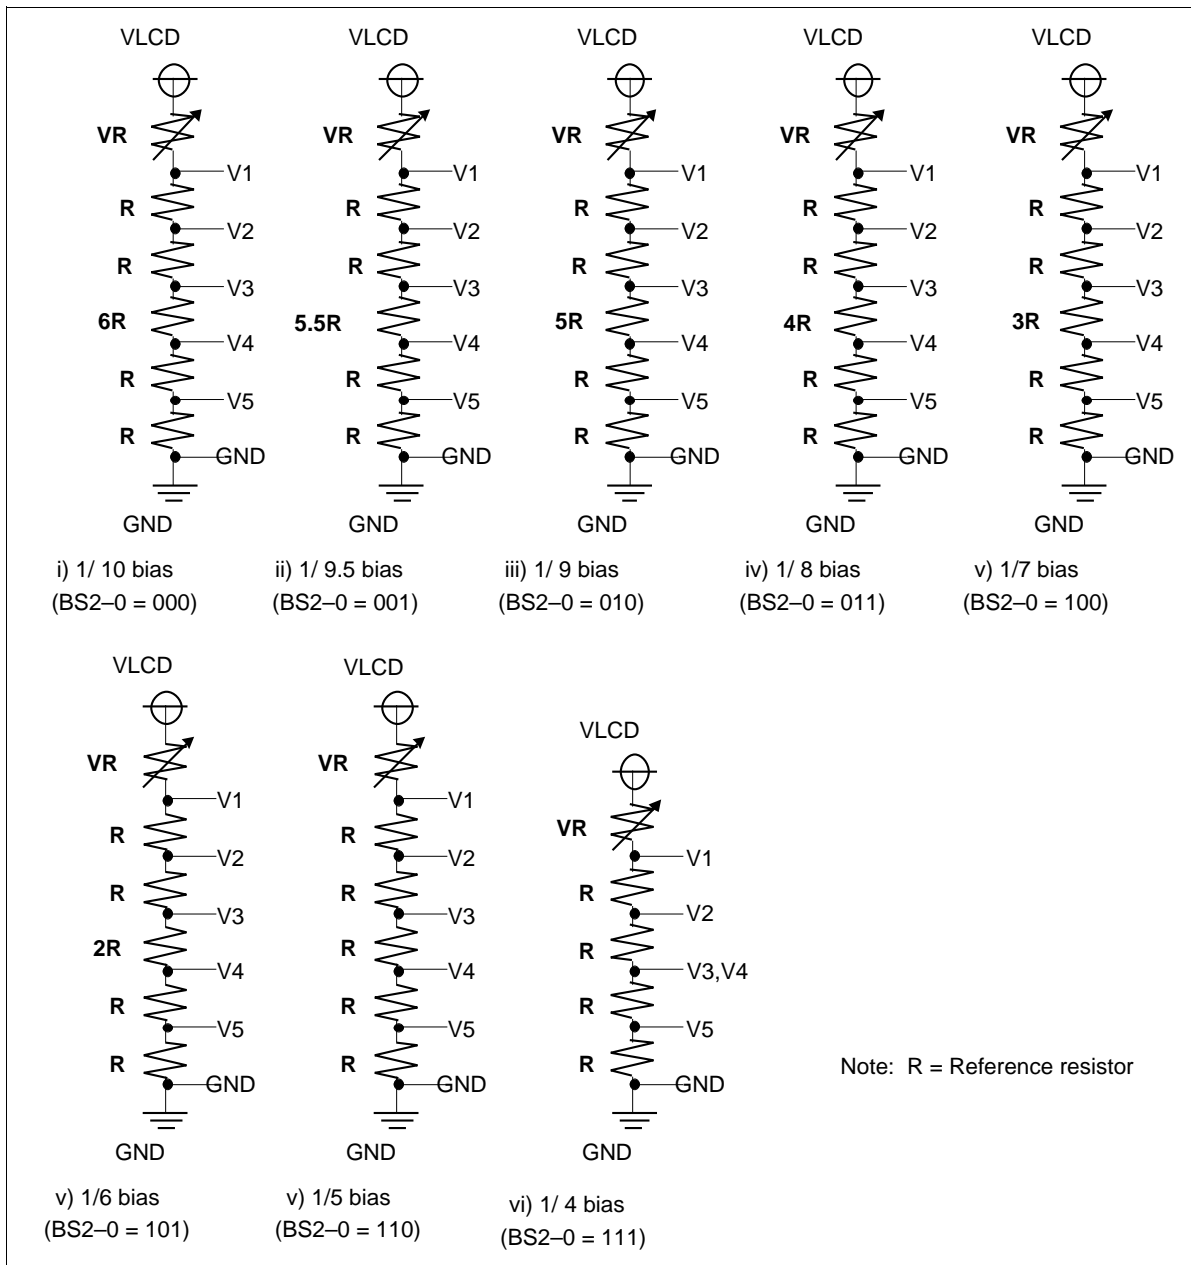

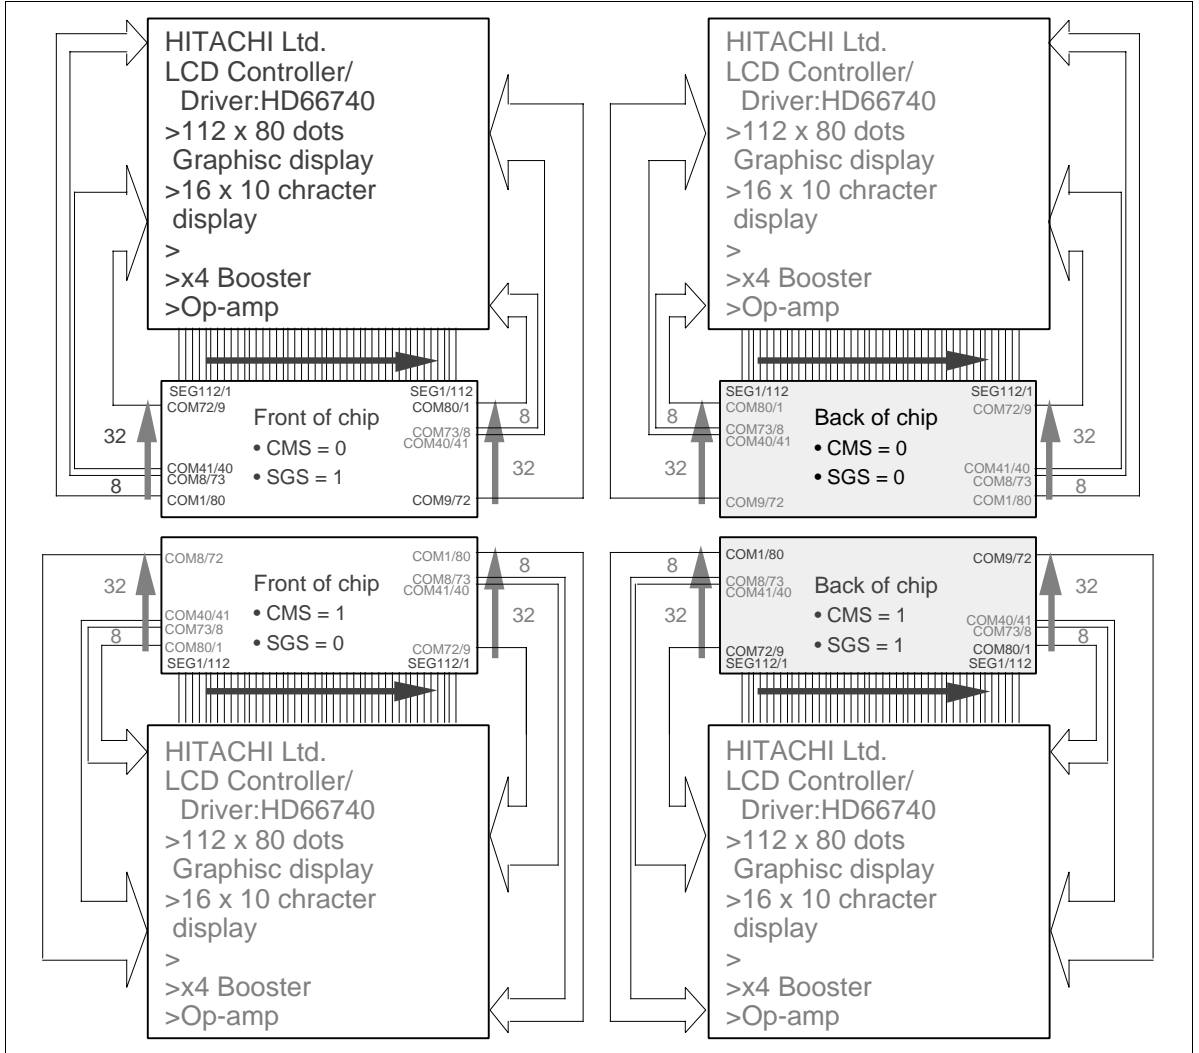

Figure 28 Liquid Crystal Display Drive Bias Circuit

## LCD Panel Interface

The HD66740 has a function for changing the common driver/segment driver output shift direction using the CMS bit and SGS bit to meet the chip mounting positions of the HD66740. This is to facilitate the interface wiring to the LCD panel with COG or TCP installed.

**Figure 29 1/80 Duty Drive Pattern Wiring**

Figure 30 1-line Display Pattern Wiring

Table 22 Number of Left and Right Extension Lines of Common Driver

Drive Duty Ratio	Left Edge of Screen	Right Edge of Screen
1/48	16 (COM1-8, 41-48)	32 (COM9-40)
1/56	24 (COM1-8, 41-56)	32 (COM9-40)
1/64	32 (COM1-8, 41-64)	32 (COM9-40)
1/72	40 (COM1-8, 41-72)	32 (COM9-40)
1/80	40 (COM1-8, 41-72)	40 (COM9-40, 73-80)

Graphics Display Function

In the graphics display mode, kanji characters, special symbols, and graphics icons can be displayed. Up to 112 × 80-dot display is allowed using the CGRAM. Thus, for a 12 × 13-dot kanji font, up to a 6-line × 9-character kanji display, and for a 14 × 15-dot kanji font, up to a 6-line × 8-character kanji display, and for a 16 × 16-dot kanji font, up to a 5-line × 6-character kanji display are allowed.

example  
(6-line x 9-character display)

ii) 112 x 80-dot game display  
example

Figure 31 Display Example in Graphics Display Mode

## **Vertical Smooth Scroll Display**

The HD66740 can scroll character and graphics display vertically in units of raster-rows. This is achieved by writing display data into a one-line area that is not being used for display. In other words, one line can be used to achieve continuous smooth vertical scroll even in a 9-line or less display. Here, after the 10th line is displayed, the first line is displayed again. When the 10th line is fully displayed, all one-line display data must be rewritten immediately after scrolling because there is no non-displayed area. Additionally, when display areas of a graphics icon such as a pictogram or a menu bar are partially fixed-displayed, the remaining areas can be displayed. For details, see the Partial Smooth Scroll Display Function section.

Specifically, this function is controlled by incrementing or decrementing the value in the display-start line bits (SL2 to SL0) and display-start raster-row bits (SN3 to SN0) by 1. For example, to smoothly scroll up, first set line bits SN3 to SN0 to 0000, and increment SL2 to SL0 by 1 from 000 to 111 to scroll seven raster-rows. Then increment line bits SN3 to SN0 to 0001, and again increment SL2 to SL0 by 1 from 000 to 111. If the vertical double-height display is at the top of the line, scrolling is done by each two raster-row.

When the response speed of the liquid crystal is low or when high-speed scrolling is needed, two- to four-raster-row scrolling is recommended.

Setting Instructions (10-line Display: NL3-0 = 1001)

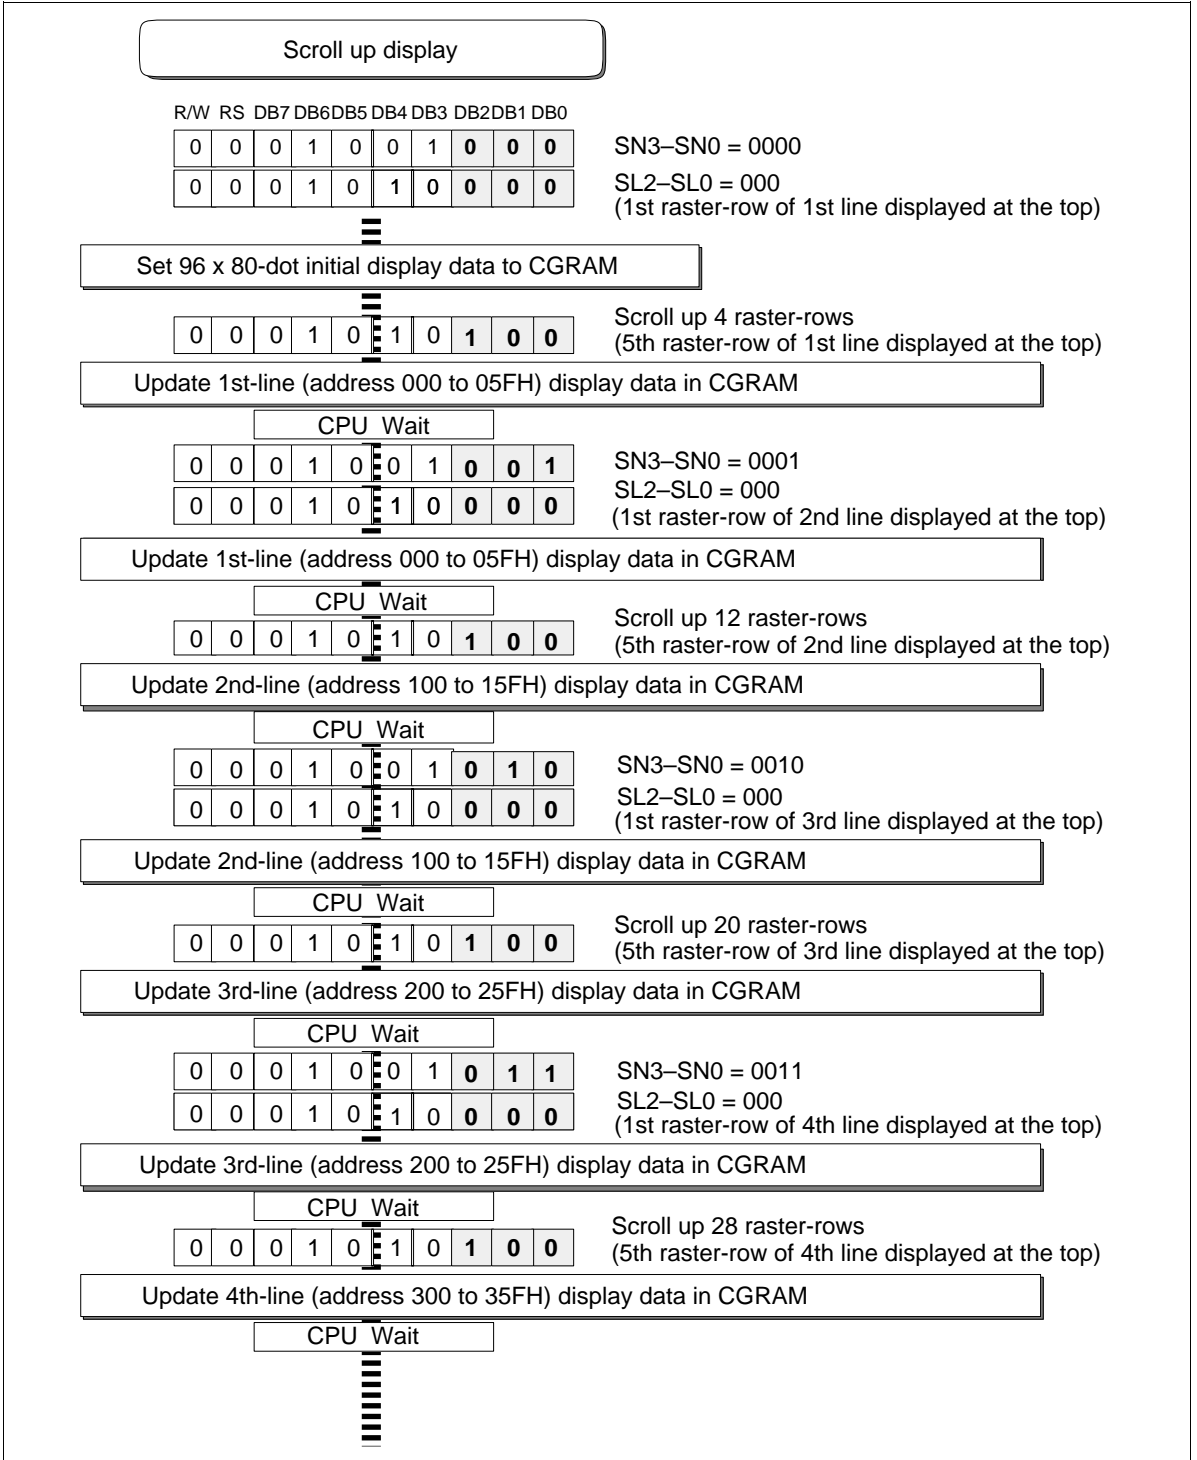

Figure 32 Setting Instructions for Vertical Smooth Scroll

## **Partial Smooth Scroll Display Function**

The HD66740 can partially fixed-display the areas of a graphics icon, such as a pictogram or a menu bar, and perform vertical smooth scrolling of the remaining bit-map areas. Since the PS1 to PS0 bits do not perform smooth scrolling of the upper first to third display lines but does fixed-display, pictograms can be placed. When CN1 to CN0 bits are set to 10, the first line is displayed at the bottom edge of the LCD screen, and the menu bar can be fixed-displayed at the bottom. This function can largely control the bit-map rewrite frequencies and reduce software loads.

**Table 23 Bit Setting and Display Lines**

Bit Setting	CN1-0 = 00					CN1-0 = 10					
	COM Position	SN3-0 = 0000	SN3-0 = 0001	SN3-0 = 0010	SN3-0 = 0011	SN3-0 = 0011	SN3-0 = 0000	SN3-0 = 0001	SN3-0 = 0010	SN3-0 = 0011	SN3-0 = 0100

		7th line	8th line	9th line	10th line	4th line	1st line	1st line	1st line	1st line	1st line

- Notes:
1. The shadow lines above are fixed-displayed. They do not depend on the setting values of the SN3-0 or SL3-0 bits.
  2. The SN3-0 and SL3-0 bits specify the next first scroll display line of the fixed-displayed lines.
  3. When the drive duty ratio is nine lines (1/72 duty ratio) or less and CN1-0 is 10, the first line shifts to the last displayed line.

- ii) Four-dot partial scroll up
  - PS1-0 = "10" : Fixed-displays the first and second lines
  - CN1-0 = "10" : Moves the first line to the bottom edge
  - SN3-0 = "0010" : Starts display from the third line
  - SL2-0 = "100" : Shifts up by 4 dots

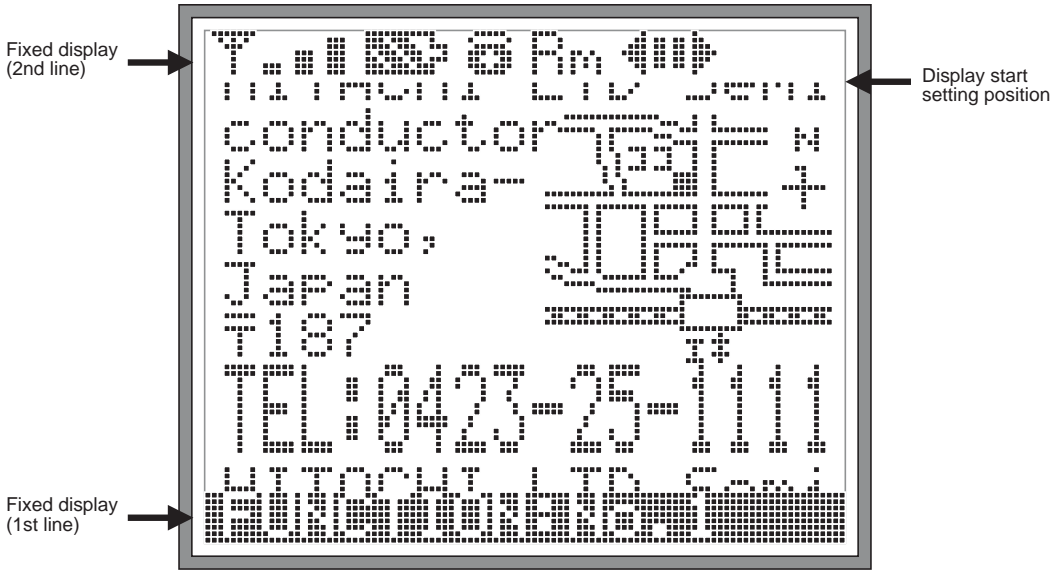

Figure 34 Example of Display Screen in the Partial Smooth Scroll Mode (1)

- iii) 8-dot partial scroll up
  - PS1-0 = "10" : Fixed-displays the first and second lines
  - CN1-0 = "10" : Moves the first line to the bottom edge
  - SN3-0 = "0011" : Starts display from the fourth line
  - SL2-0 = "000"

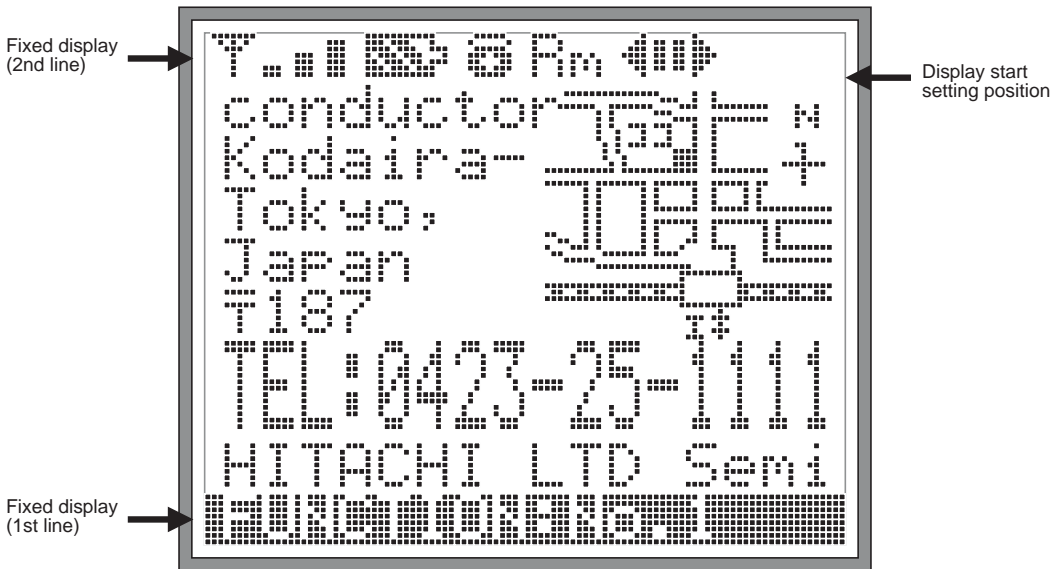

Figure 35 Example of Display Screen in the Partial Smooth Scroll Mode (2)

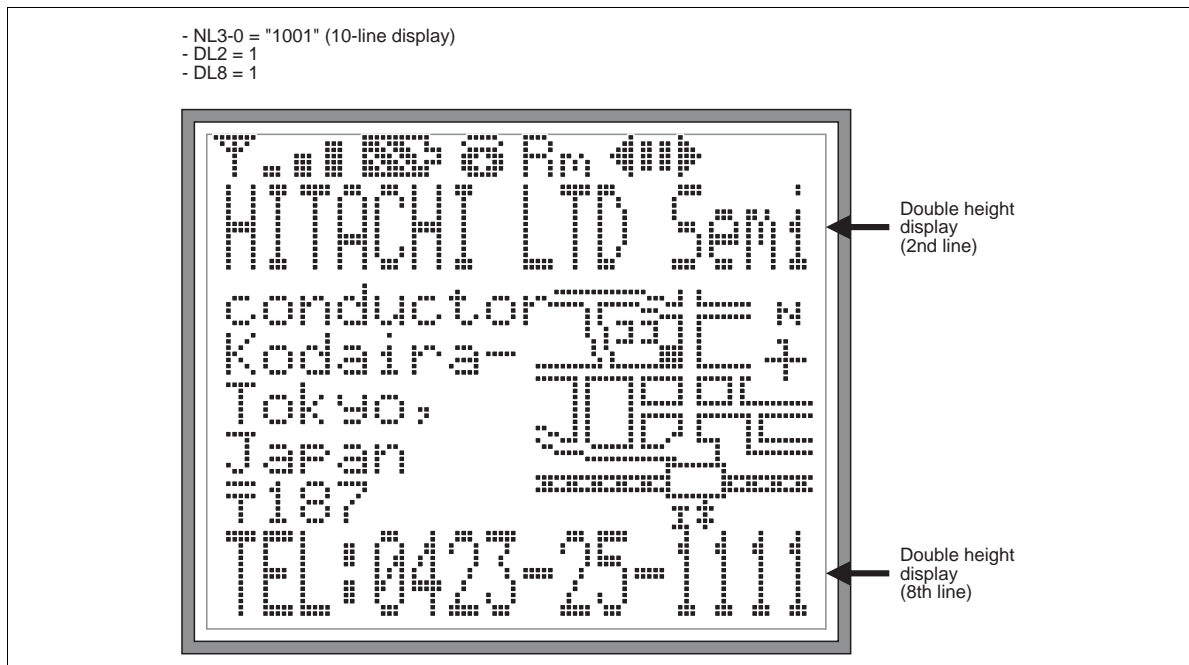

## Double-height Display

The HD66740 can double the height of any desired line from the first to 10th lines. A line can be selected by the DL1 to DL10 bits as listed in table 25. All graphics display patterns stored in the CGRAM can be doubled in height, allowing easy recognition. Note that there should be no space between the lines for double-height display (figure 36).

In vertical smooth scrolling, when the display-start setting line is displaying at double height, scrolling can be done by each two-line (dot).

**Table 25 Double-height Display Specifications**

Bit Setting	Display Position
DL1 = 1	1st line: double-height
DL2 = 1	2nd line: double-height
DL3 = 1	3rd line: double-height
DL4 = 1	4th line: double-height
DL5 = 1	5th line: double-height
DL6 = 1	6th line: double-height
DL7 = 1	7th line: double-height
DL8 = 1	8th line: double-height
DL9 = 1	9th line: double-height
DL10 = 1	10th line: double-height

**Figure 36 Double-height Display (2nd and 8th Lines)**

### Reversed Display Function

The HD66740 can display character/graphics display sections by black-and-white reversal. Black-and-white reversal can be easily displayed when REV is set to 1.

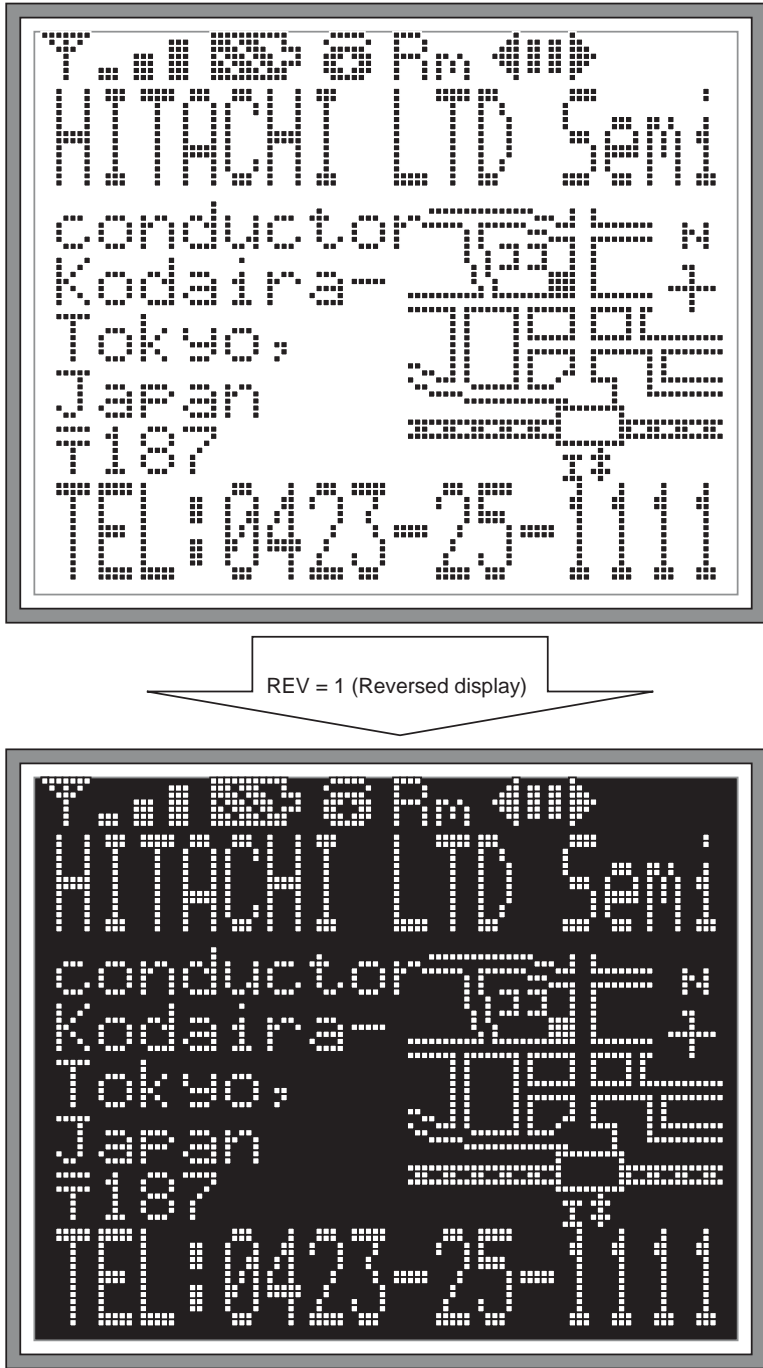

Figure 37 Reversed Display

## Partial-display-on Function

The HD66740 can program the liquid crystal display drive duty ratio setting (NL3–0 bits), liquid crystal display drive bias value selection (BS2–0 bits), boost output level selection (BT1/0 bit) and contrast adjustment (CT5–0 bits). For example, in the 10-line display mode (1/80 duty ratio), the HD66740 can selectively drive only the center of the screen or only the top or bottom of the screen by combining these register functions and the centering display (CN1–0 bit) function. This is called partial-display-on. Lowering the liquid crystal display drive duty ratio as required saves the liquid crystal display drive voltage, thus reducing internal current consumption. This is suitable for four-line display of a calendar or time, or the display of only graphics icons (pictograms) at the top or bottom of the screen, which needs to be continuous in the system standby state with minimal current consumption. Here, the non-displayed lines are constantly driven by the unselected level voltage, thus turning off the LCD for the lines.

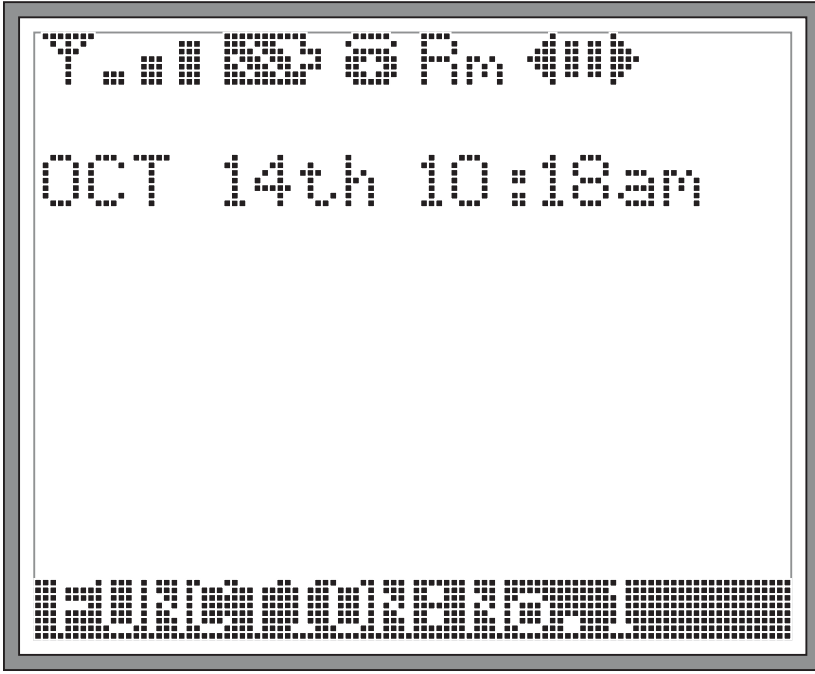

In general, lowering the liquid crystal display drive duty ratio decreases the optimum liquid crystal display drive voltage and liquid crystal display drive bias value. This reduces output multiplying factors in the booster and greatly controls consumption current.

**Table 26 Partial-display-on Function (10-line Display)**

Item	Normal 10-line Display	Partial-on Display (Limited 4-line Display)	
LCD screen	10th line displayed	Only four lines on the center of the screen (from the 3rd to 6th lines)	Only four lines at the top and bottom of the screen (from the 1st to 3rd and 10th lines)
LCD drive position shift	Not necessary (CN1–0 = 00)	Necessary (CN1–0 = 01)	Necessary (CN1–0 = 01)
LCD drive duty ratio	1/80 (NL3–0 = 1001)	1/32 (NL3–0 = 0011)	1/32 (NL3–0 = 0011)
LCD drive bias value (optimum)	1/10 (BS2-0 = 000)	1/6 (BS2-0 = 101)	1/6 (BS2-0 = 101)
LCD drive voltage*	12 V to 15 V (adjustable using CT5–0)	6 V to 8 V (adjustable using CT5–0)	6 V to 8 V (adjustable using CT5–0)
Boosting output multiplying factor	Five times (BT1–0 = 10)	Triple (BT1–0 = 00)	Triple (BT1–0 = 00)
Frame frequency (fosc = 90 kHz)	70 Hz	88 Hz	88 Hz

Note: The LCD drive voltage depends on the LCD materials which are actually used. Since the LCD drive voltage is high when the LCD drive duty ratio is high, a low duty ratio is suitable for low-power consumption.

- 1/32 duty drive at the top and bottom of the screen

Always applying non-selection level

Figure 38 Partial-on Display (Date and Time Indicated) (1)

- 1/32 duty drive at the center of the screen

Always applying selection level

Figure 39 Partial-on Display (Date and Time Indicated) (2)

## Sleep Mode

Setting the sleep mode bit (SLP) to 1 puts the HD66740 in the sleep mode, where the device stops all internal display operations, thus reducing current consumption. Specifically, LCD drive is completely halted. Here, all the SEG (SEG1 to SEG112) and COM (COM1 to COM80) pins output the GND level, resulting in no display. If the AMP bit is set to 0 in the sleep mode, the LCD drive power supply can be turned off, reducing the total current consumption of the LCD module.

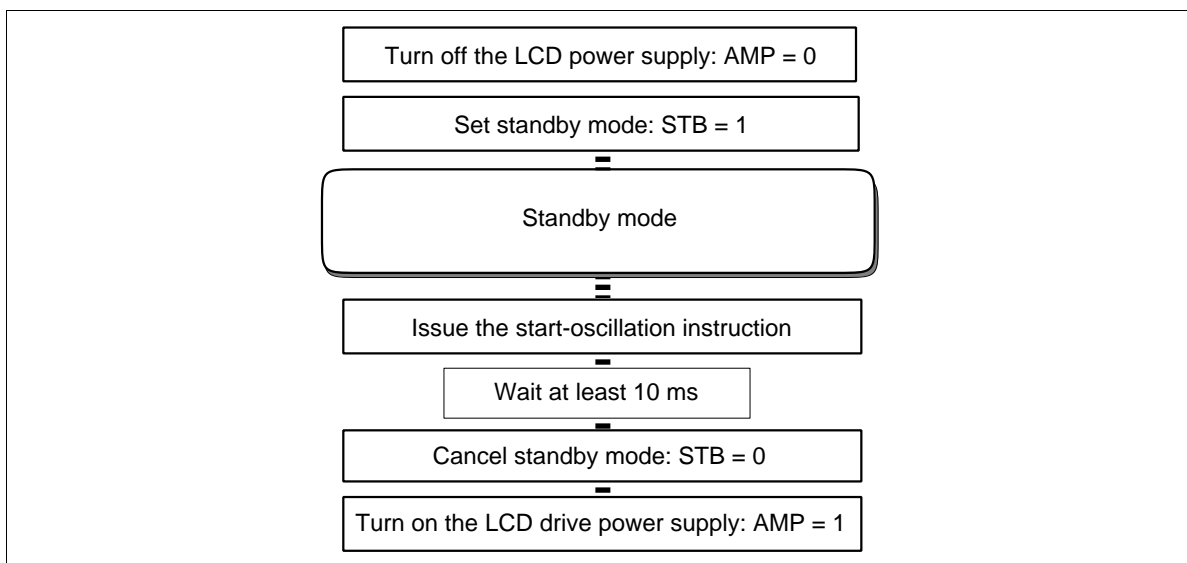

**Table 27 Comparison of Sleep Mode and Standby Mode**

Function	Sleep Mode (SLP = 1)	Standby Mode (STB = 1)
LCD control	Turned off	Turned off
R-C oscillation circuit	Operates normally	Halted

## Standby Mode

Setting the standby mode bit (STB) to 1 puts the HD66740 in the standby mode, where the device stops completely, halting all internal operations including the R-C oscillation circuit, thus further reducing current consumption compared to that in the sleep mode. Specifically, character and segment displays, which are controlled by the multiplexing drive method, are completely halted. Here, all the SEG (SEG1 to SEG112) and COM (COM1 to COM80) pins output the GND level, resulting in no display. If the AMP bit is set to 0 in the standby mode, the LCD drive power supply can be turned off.

During the standby mode, no instructions can be accepted other than the start-oscillation. To cancel the standby mode, issue the start-oscillation instruction to stabilize R-C oscillation before setting the STB bit to 0.

**Figure 40 Procedure for Setting and Canceling Standby Mode**

**Absolute Maximum Ratings**

<b>Item</b>	<b>Symbol</b>	<b>Unit</b>	<b>Value</b>	<b>Notes*</b>
Power supply voltage (1)	$V_{CC}$	V	-0.3 to +4.6	1, 2
Power supply voltage (2)	$V_{LCD} - GND$	V	-0.3 to +16.0	1, 3
Input voltage	$V_t$	V	-0.3 to $V_{CC} + 0.3$	1
Operating temperature	$T_{opr}$	°C	-40 to +85	1, 4
Storage temperature	$T_{stg}$	°C	-55 to +110	1, 5

- Notes: 1. If the LSI is used above these absolute maximum ratings, it may become permanently damaged. Using the LSI within the following electrical characteristics limits is strongly recommended for normal operation. If these electrical characteristic conditions are also exceeded, the LSI will malfunction and cause poor reliability.
2.  $V_{CC} > GND$  must be maintained.
  3.  $V_{LCD} > GND$  must be maintained.
  4. For bare die and wafer products, specified up to 85°C.
  5. This temperature specifications apply to the TCP package.

**DC Characteristics ( $V_{CC} = 1.8$  to  $3.6$  V,  $T_a = -40$  to  $+85^\circ\text{C}^{*1}$ )**

Item	Symbol	Min	Typ	Max	Unit	Test Condition	Notes
Input high voltage	$V_{IH}$	$0.7 V_{CC}$	—	$V_{CC}$	V		2, 3
Input low voltage	$V_{IL}$	-0.3	—	$0.15 V_{CC}$	V	$V_{CC} = 1.8$ to $2.7$ V	2, 3
Input low voltage	$V_{IL}$	-0.3	—	$0.15 V_{CC}$	V	$V_{CC} = 2.7$ to $3.6$ V	2, 3
Output high voltage (SDA, DB0-7 pins)	$V_{OH1}$	$0.75 V_{CC}$	—	—	V	$I_{OH} = -0.1$ mA	2, 4
Output low voltage (SDA, DB0-7 pins)	$V_{OL1}$	—	—	$0.2 V_{CC}$	V	$V_{CC} = 1.8$ to $2.7$ V, $I_{OL} = 0.1$ mA	2
Output low voltage (SDA, DB0-7 pins)	$V_{OL1}$	—	—	$0.15 V_{CC}$	V	$V_{CC} = 2.7$ to $3.6$ V, $I_{OL} = 0.1$ mA	2
Driver ON resistance (COM pins)	$R_{COM}$	—	3	20	k $\Omega$	$\pm I_d = 0.05$ mA, $V_{LCD} = 10$ V	5
Driver ON resistance (SEG pins)	$R_{SEG}$	—	3	30	k $\Omega$	$\pm I_d = 0.05$ mA, $V_{LCD} = 10$ V	5
I/O leakage current	$I_{Li}$	-1	—	1	$\mu\text{A}$	$V_{in} = 0$ to $V_{CC}$	6
Pull-up MOS current (DB0-7, SDA pin)	$-I_p$	1	10	40	$\mu\text{A}$	$V_{CC} = 3$ V, $V_{in} = 0$ V	2
Current consumption during normal operation ( $V_{CC}$ -GND)	$I_{OP}$	—	32	55	$\mu\text{A}$	R-C oscillation, $V_{CC} = 3$ V, $T_a = 25^\circ\text{C}$ , $f_{OSC} = 86$ kHz (1/72 duty)	7, 8
Current consumption during sleep mode ( $V_{CC}$ -GND)	$I_{SL}$	—	11	—	$\mu\text{A}$	R-C oscillation, $V_{CC} = 3$ V, $T_a = 25^\circ\text{C}$ , $f_{OSC} = 86$ kHz (1/72 duty)	7, 8
Current consumption during standby mode ( $V_{CC}$ -GND)	$I_{ST}$	—	0.1	5	$\mu\text{A}$	$V_{CC} = 3$ V, $T_a = 25^\circ\text{C}$	7, 8
LCD drive power supply current ( $V_{LCD}$ -GND)	$I_{LCD}$	—	20	35	$\mu\text{A}$	$V_{LCD} = 12$ V, $T_a = 25^\circ\text{C}$ , $f_{OSC} = 86$ kHz, 1/9 bias, VTEST3 = "High"	8
LCD drive voltage ( $V_{LCD}$ -GND)	$V_{LCD}$	4.5	—	15.0	V		9

Note: For the numbered notes, refer to the Electrical Characteristics Notes section following these tables.

**Booster Characteristics**

Item	Symbol	Min	Typ	Max	Unit	Test Condition	Notes
Triple-boost output voltage (VLOUT pin)	$V_{UP3}$	8.5	8.9	9.0	V	$V_{CC} = V_{ci} = 3.0 \text{ V}$ , $I_o = 30 \mu\text{A}$ , $C = 1 \mu\text{F}$ , $f_{OSC} = 86 \text{ kHz}$ , $T_a = 25^\circ\text{C}$	12
Quadruple-boost output voltage (VLOUT pin)	$V_{UP4}$	11.5	11.8	12.0	V	$V_{CC} = V_{ci} = 3.0 \text{ V}$ , $I_o = 30 \mu\text{A}$ , $C = 1 \mu\text{F}$ , $f_{OSC} = 86 \text{ kHz}$ , $T_a = 25^\circ\text{C}$	12
Five-times-boost output voltage (VLOUT pin)	$V_{UP5}$	14.5	14.8	15.0	V	$V_{CC} = V_{ci} = 3.0 \text{ V}$ , $I_o = 30 \mu\text{A}$ , $C = 1 \mu\text{F}$ , $f_{OSC} = 86 \text{ kHz}$ , $T_a = 25^\circ\text{C}$	12
Use range of boost output voltage	$V_{UP3}$ , $V_{UP4}$ , $V_{UP5}$	Vcc	—	15.0	V	For triple to Five-times boost	12

Note: For the numbered notes, refer to the Electrical Characteristics Notes section following these tables.

### Electrical Characteristics Notes

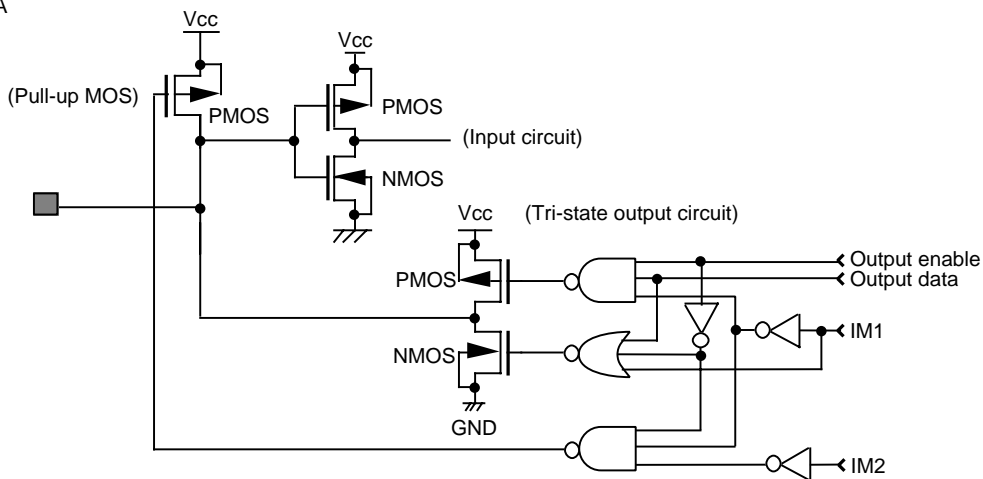

1. For bare die products, specified up to 85°C.
2. The following three circuits are I/O pin configurations (figure 41).

Pins: RESET\*, CS\*, E/WR\*/SCL, RS,  
OSC1, OPOFF, IM2/1, IM0/ID, TEST

Pin: OSC2

Pin: RW/RD\*/SDA

Pin: DB7 to DB0

Figure 41 I/O Pin Configuration

3. The TEST pin must be grounded and the IM2/1, IM0/ID, and OPOFF pins must be grounded or connected to Vcc.
4. Corresponds to the high output for clock-synchronized serial interface.
5. Applies to the resistor value (RCOM) between power supply pins V1OUT, V2OUT, V5OUT, GND and common signal pins, and resistor value (RSEG) between power supply pins V1OUT, V3OUT, V4OUT, GND and segment signal pins, when current Id is flown through all driver output pins.
6. This excludes the current flowing through pull-up MOSs and output drive MOSs.
7. This excludes the current flowing through the input/output units. The input level must be fixed high or low because through current increases if the CMOS input is left floating.
8. The following shows the relationship between the operation frequency (fosc) and current consumption (Icc) (figure 42).

**Figure 42 Relationship between the Operation Frequency and Current Consumption**

9. Each COM and SEG output voltage is within  $\pm 0.15$  V of the LCD voltage (Vcc, V1, V2, V3, V4, V5) when there is no load.
10. Applies to the external clock input (figure 43).

**Figure 43 External Clock Supply**

11. Applies to the internal oscillator operations using external oscillation resistor Rf (figure 44 and table 28).

Figure 44 Internal Oscillation

Table 28 External Resistance Value and R-C Oscillation Frequency (Referential Data)

External Resistance (Rf)	R-C Oscillation Frequency: fosc			
	Vcc = 1.8 V	Vcc = 2.2 V	Vcc = 3.0 V	Vcc = 3.6 V
200 kΩ	89 kHz	103 kHz	115 kHz	121 kHz
270 kΩ	70 kHz	80 kHz	88 kHz	92 kHz
300 kΩ	65 kHz	73 kHz	80 kHz	83 kHz
330 kΩ	60 kHz	68 kHz	74 kHz	77 kHz
360 kΩ	55 kHz	62 kHz	68 kHz	71 kHz
390 kΩ	52 kHz	58 kHz	64 kHz	66 kHz
430 kΩ	48 kHz	53 kHz	58 kHz	60 kHz
470 kΩ	44 kHz	48 kHz	52 kHz	54 kHz

12. Booster characteristics test circuits are shown in figure 45.

Figure 45 Booster

Referential data

VUP4 = VLCD – GND; VUP5 = VLCD – GND

(i) Relation between the obtained voltage and input voltage

Quadruple boosting

V<sub>ci</sub> = V<sub>cc</sub>, f<sub>osc</sub> = 86 kHz, T<sub>a</sub> = 25°C  
DCC = 0

Five-times boosting

V<sub>ci</sub> = V<sub>cc</sub>, f<sub>osc</sub> = 86 kHz, T<sub>a</sub> = 25°C  
DCC = 0

(ii) Relation between the obtained voltage and temperature

Quadruple boosting

V<sub>ci</sub> = V<sub>cc</sub> = 3 V, f<sub>osc</sub> = 86 kHz, I<sub>o</sub> = 30μA  
DCC = 0

Five-times boosting

V<sub>ci</sub> = V<sub>cc</sub> = 3 V, f<sub>osc</sub> = 86 kHz, I<sub>o</sub> = 30μA  
DCC = 0

(iii) Relation between the obtained voltage and capacity

Quadruple boosting

V<sub>ci</sub> = V<sub>cc</sub> = 3.0 V, f<sub>osc</sub> = 86 kHz, I<sub>o</sub> = 30 μA  
DCC = 0

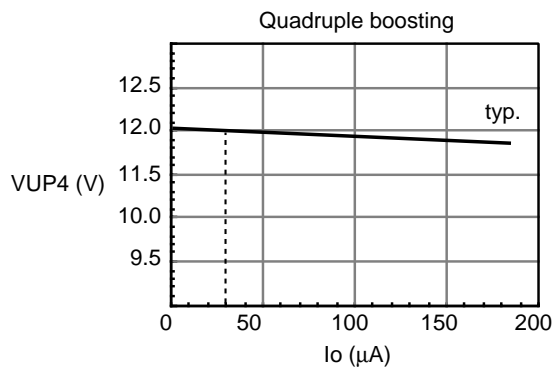

Five-times boosting

V<sub>ci</sub> = V<sub>cc</sub> = 3.0 V, f<sub>osc</sub> = 86 kHz, I<sub>o</sub> = 30 μA  
DCC = 0

Figure 45 Booster (cont)

(iv) Relation between the obtained voltage and current

$V_{ci} = V_{cc} = 3.0$  V,  $f_{osc} = 86$  kHz,  $T_a = 25$  °C  
DCC = 0

$V_{ci} = V_{cc} = 3.0$  V,  $f_{osc} = 86$  kHz,  $T_a = 25$  °C  
DCC = 0

1. Hitachi neither warrants nor grants licenses of any rights of Hitachi's or any third party's patent, copyright, trademark, or other intellectual property rights for information contained in this document. Hitachi bears no responsibility for problems that may arise with third party's rights, including intellectual property rights, in connection with use of the information contained in this document.
2. Products and product specifications may be subject to change without notice. Confirm that you have received the latest product standards or specifications before final design, purchase or use.
3. Hitachi makes every attempt to ensure that its products are of high quality and reliability. However, contact Hitachi's sales office before using the product in an application that demands especially high quality and reliability or where its failure or malfunction may directly threaten human life or cause risk of bodily injury, such as aerospace, aeronautics, nuclear power, combustion control, transportation, traffic, safety equipment or medical equipment for life support.
4. Design your application so that the product is used within the ranges guaranteed by Hitachi particularly for maximum rating, operating supply voltage range, heat radiation characteristics, installation conditions and other characteristics. Hitachi bears no responsibility for failure or damage when used beyond the guaranteed ranges. Even within the guaranteed ranges, consider normally foreseeable failure rates or failure modes in semiconductor devices and employ systemic measures such as fail-safes, so that the equipment incorporating Hitachi product does not cause bodily injury, fire or other consequential damage due to operation of the Hitachi product.
5. This product is not designed to be radiation resistant.
6. No one is permitted to reproduce or duplicate, in any form, the whole or part of this document without written approval from Hitachi.
7. Contact Hitachi's sales office for any questions regarding this document or Hitachi semiconductor products.
