

High-Capacitive Electrolytic Capacitors with Solder Pins, Insulated, Polarized, Etched Electrodes, Pulse-Proof

EYF 00
EYF 06

The EYF type belongs to the high-capacitive electrolytic capacitors that are noted for the small design, wide temperature range, high operational reliability and constancy of the electric values.
This type has been especially developed for equipment of the entertainment and industrial electronics (switch-mode power supplies), the concept of which allows only very small capacitor dimensions.

Equivalent series resistance $R_{ESR} (\Omega)$:

For limit values¹⁾ at 100 Hz and 20°C, see table with individual values.

Dissipation factor $\tan \delta$:

For limit values at 100 Hz and 20°C, see table with individual values.

¹⁾ The practically achievable series resistance and impedance are limited downwards by the ohmic share of the connections and the foil resistances. For this reason, calculated values below 0.03 Ω cannot be achieved in any case.

²⁾ Due to the admissible C-tolerance, the given limit values may be exceeded by max. 10 %.

1) The practically achievable series resistance and impedance are limited downwards by the ohmic share of the connection and the foil resistances. For this reason, calculated values below 0.03 Ω cannot be achieved in any case.

2) For deviating temperature and frequencies, the admissible superimposed ripple current has to be corrected with the respective conversion factors (see "General Information").
